Republic of Zambia

RURAL ELECTRIFICATION MASTER PLAN FOR ZAMBIA (2025 - 2030)

Towards Universal Energy Access

April, 2026

This version of the Rural Electrification Master Plan (REMP) shall be referred to as REMP 2.0, succeeding the 2008 REMP. It is intended to serve as a living document, subject to periodic review and updates to incorporate new data, technological developments, and evolving policy and planning priorities.

Prepared by the **Rural Electrification Authority (REA)**
with technical support from **National Rural Electric Cooperative Association (NRECA) International**

www.rea.org.zm

FOREWORD

Hon. Makozo Chikote, MP
Minister of Energy

The Government of the Republic of Zambia (GRZ) is committed to attaining universal access to affordable, reliable, sustainable, and modern energy services in support of national socio-economic development and the United Nations-driven Sustainable Development Goals (SDGs). These goals guide the country's development objectives articulated in Vision 2030 and successive national development plans that target to make Zambia a middle-income country by 2030. Increased access to electricity in rural areas is expected to significantly contribute to the country's goal of achieving middle-income status by improving livelihoods and catalysing socio-economic activities.

To enhance rural electrification efficiently, GRZ with support from the Japan International Cooperation Agency (JICA), developed the Rural Electrification Master Plan (REMP), which was launched in 2008. Over the past 16 years, the 2008 REMP has served as a blueprint for the systematic implementation of the Rural Electrification Programme (REP) in Zambia. The plan aimed to increase the rural electrification access rate from 3.1% in 2008 to 51% by 2030. This ambitious target was set to be achieved through the electrification of the identified 1,217 Rural Growth Centres (RGC) across the Country.

Since the development of the 2008 REMP, Zambia has undergone significant demographic, geographic, and social-economic changes. The administrative boundary delimitation exercise resulted in the creation of new districts, while evolving settlement patterns and increased economic activity have expanded the demand for electricity services in rural communities. Furthermore, the country's commitment to the SDGs, particularly SDG 7, underscored the need to revise the electrification targets from 51% to 100% by 2030.

To achieve the target of universal access and address the current realities on the ground, the REMP has been transformed into a dynamic and evolving plan. The REMP adopts a Least Cost Geospatial Electrification Planning (LCGEP) approach, which uses spatial analysis and demand modelling to identify the most appropriate electrification solutions for rural communities.

Under this framework, rural settlements have been organised into Electrification Areas, which cluster communities based on geographic proximity, population distribution, energy demand characteristics, and proximity to existing electricity infrastructure. The analysis identifies the most suitable electrification options for each Electrification Area including grid extension, solar mini-grids, and standalone solar systems, customised to meet the specific requirements and feasibility of each area.

Achieving universal access to electricity by 2030 will require significant investment in electricity infrastructure. The REMP estimates that approximately US$1.52 billion will be required to expand electricity access through a combination of grid extension, solar mini-grids, and standalone solar systems during the period

2025 to 2030. This translates into an estimated average annual investment requirement of approximately US$253 million over the implementation period. To facilitate the implementation of these electrification options, the REMP also outlines a range of business models designed to facilitate project delivery and mobilise investment from GRZ, development partners, and private sector participants.

To support planning and coordination of electrification initiatives, Government has established a REMP Geographical Information System (GIS) Database to manage the datasets and analytical results generated through the planning process. In addition, a Visualization Platform has been developed to provide public access to the results of the analysis, including information on Electrification Areas and proposed electrification options. This will support GRZ institutions, development partners, private sector actors, and communities in making informed decisions and strengthening coordination of rural electrification initiatives.

The successful implementation of the REMP will expand electricity access to households and public institutions across rural Zambia, thereby improving service delivery and creating opportunities for economic development in rural communities. Reliable electricity will also enable the productive use of energy in agriculture, micro and small enterprises, agro-processing, education, and healthcare, which are essential for accelerating rural socio-economic transformation.

I therefore call upon cooperating partners, private sector investors, financial institutions, and local communities to support the implementation of this plan as we work together to achieve universal access to electricity for all Zambians by 2030.

ACKNOWLEDGEMENTS

Eng. Arnold M. Simwaba
Permanent Secretary – Electricity
Ministry of Energy

The REMP update was undertaken through a consultative process led by the Ministry of Energy (MoE), in collaboration with REA and a wide range of stakeholders. The Ministry extends its sincere appreciation to all institutions and individuals who contributed their time, expertise, and insights during the development of this plan.

Special appreciation is extended to the Presidential Delivery Unit (PDU) for its continued support in advancing Zambia's electrification agenda and for facilitating coordination in the implementation of key national development priorities.

The Ministry also expresses its sincere gratitude to the National Rural Electric Cooperative Association (NRECA) International for providing technical assistance in updating the REMP. NRECA International played a central role in supporting geospatial electrification planning and analysis that informed the development of this plan.

The Ministry further acknowledges the valuable support provided by Cities and Infrastructure for Growth Zambia (CiG Zambia), whose contribution strengthened stakeholder engagement and the plan's overall development.

In addition, appreciation is extended to representatives from GRZ Ministries, statutory bodies, cooperating partners, non-governmental organisations, civil society organisations, traditional leadership, the private sector, and academia, whose participation and valuable contributions helped shape the REMP.

The successful implementation of the REMP and the attainment of universal access to electricity in rural areas will depend on continued collaboration among GRZ institutions, development partners, private sector stakeholders, traditional leadership, and local communities. The Ministry will continue to provide the necessary policy direction and leadership in line with the Government's development aspirations.

WORKING DEFINITIONS

Access	Sufficient, reliable electricity from any energy source capable of performing the task of lighting, phone charging, and powering appliances and with a minimum operation of four (4) hours per day.
Business Model	Operational framework to deliver and sustain electricity services to rural areas.
Cluster	A group of nearby housing structures or settlements that are aggregated for electrification planning and used as a unit of analysis for estimating electricity demand and identifying appropriate electrification solutions.
Electric Cooperative	A member-owned, not-for-profit utility established to provide electricity services to its members, typically in rural or underserved areas, and governed through democratic control.
Electrification Area	Cluster of communities based on geographic proximity, population distribution, energy demand characteristics, and proximity to existing electricity infrastructure.
Electrification Methodology	Process of determining the appropriate technology for each Electrification Area based on demand, socio-economic and geographical characteristics.
Energy Efficiency	Method of reducing energy consumption by using less energy to attain the same amount of useful output.
Gender Equality	Full and equal enjoyment, by both sexes, of rights, opportunities, responsibilities and freedoms and where both sexes are equally treated.
Geographic Information System	A computer-based tool used to capture, store, analyse, and present geographically referenced data.
Geospatial Data	Refers to information that is associated with a specific geographic location and is typically represented using coordinates.
Grid Development	Refers to the planning, expansion, reinforcement, and modernisation of electricity networks to meet growing demand and improve reliability of supply.
Grid Densification	Expansion of existing low voltage networks to connect clusters within 800 meters of existing distribution transformers.
Grid Extension	A network expansion from the national power distribution system to new areas and communities that involves extension of the Medium Voltage (MV) by a length of more than 5km.
Grid Intensification	A network expansion from the national power distribution system to new areas and communities that involves extension of the Medium Voltage (MV) by a length of less than 5km.
Low Voltage	The set of nominal voltage levels that are used for the distribution of electricity and whose upper limit is generally accepted to be an A.C. voltage of 1,000V (or a D.C. voltage of 1,500V).
Low Voltage Mini-Grid	Means any electricity supply system unconnected to the national grid and has its own power generation capacity, supplying electricity to more than one customer through a 400 V distribution line.
Medium Voltage	The set of nominal voltage levels used in power systems which are above 1 kV but not exceeding 33 kV.

Medium Voltage Mini-Grid	Means any electricity supply system unconnected to the national grid and has its own power generation capacity, supplying electricity to more than one customer through an 11 kV distribution line.
Mini-Grid	Means any electricity supply system unconnected to the national grid and has its own power generation capacity, supplying electricity to more than one customer through a distribution line.
Off-Grid System	An electrical system that operates independently of the main or national electrical grid.
Rural Area	An area that is not declared a city or established as a municipality under the Local Government Act, 2019.
Rural Growth Centre	A rural locality characterised by a relatively high concentration of residential settlements and economic activities that serve surrounding communities.
Rural Growth Centre Concept	A structured approach for prioritising electrification investments by focusing on rural areas with relatively higher population densities and economic activities.
Social Inclusion	The process of improving the terms of participation in society, particularly for those who are disadvantaged, by enhancing opportunities, access to resources, voice, and respect for rights.
Universal Access	Access to affordable, reliable, and modern energy services to all people, regardless of their geographic location and socio-economic status.
Urban Area	A settlement with at least 5000 people, where at least half of the residents are not engaged in agriculture, and that has access to electricity, piped water, schools, and health facilities.

ZEMA	Zambia Environmental Management Agency
ZPPA	Zambia Public Procurement Authority

CHAPTER 1. INTRODUCTION

1.1. Background

Zambia has committed to enhancing its energy sector and increasing access to electricity through electrification programmes and plans. To support this objective, the 2008 Rural Electrification Master Plan (REMP) has been guiding the implementation of the Rural Electrification Programme (REP) with the objective of increasing the rural electricity access rate from 3.1% in 2008 to 51% by 2030 at an estimated cost of US$1.1 billion.

At the global level, the United Nations (UN) in 2012 developed the Seventeen (17) Sustainable Development Goals (SDGs). These SDGs were intended to create a comprehensive, universal, and integrated framework to address the world's most pressing challenges and ensure that people live in dignity, prosperity, and peace within the planet's environmental limits. Among these goals, Sustainable Development Goal No. 7 (SDG7) focuses on ensuring access to affordable, reliable, sustainable, and modern energy for all, including rural communities, by 2030.

In line with this global target, GRZ became a signatory to the United Nations Agenda 2030 in 2015, thereby demonstrating its commitment to achieving the SDGs. Consequently, the aspiration for universal access to electricity by 2030 has been included in national development frameworks, including Vision 2030, the 2019 National Energy Policy (NEP), and successive National Development Plans (NDPs).

Furthermore, the GRZ has since undertaken several policy and legislative reforms to support the attainment of universal electricity access. These include the development of the 2023 Integrated Resource Plan (IRP) to replace the Power System Development Master Plan (PSDP) and the 2022 Least Cost Geospatial Electrification Plan (LCGEP). In addition, the Rural Electrification Act No. 5 of 2023 was enacted, expanding the REA's mandate in pursuit of this goal.

To monitor the progress towards achieving universal access by 2030, the Ministry of Energy (MoE) conducted the National Energy Access Survey (NEAS) in 2023. The survey results indicate that the rural electrification access rate had increased to 34%, demonstrating significant progress since the introduction of the REMP, but also highlighting the remaining gap towards achieving universal electricity access by 2030.

Against this background, the REMP has been updated to provide an improved planning framework that reflects current national policy priorities, incorporates advances in electrification technologies and planning methodologies, and supports the coordinated expansion of electricity access across rural Zambia.

1.2 Rationale for Updating the REMP

Since the development of the 2008 REMP, Zambia has undergone significant demographic, geographic, and socio-economic changes that have influenced the planning and implementation of the REPs. The creation of a new province and 44 new districts through the delimitation exercise, changes in settlement patterns, and increasing demand for electricity services in rural communities have altered the rural development landscape and the spatial distribution of electricity demand.

The 2008 REMP was developed on the RGC concept, which prioritised the electrification of selected rural areas of economic activities and potential for growth, primarily through grid extension. The expectation was that nearby villages would subsequently gain access to electricity as distribution networks expanded from these centres. However, in practice, many surrounding communities did not gain access to electricity as originally anticipated. Factors such as the distance between villages and electrified centres, the cost of extending distribution networks, affordability, lack of last mile programmes, and low population density limited the spread of electricity beyond the initial connection points. As a result, many rural communities remained without access to electricity despite the electrification of nearby RGCs.

In addition, the 2008 REMP was based on outdated demographic plans, administrative, and infrastructure data, which no longer fully reflect the current spatial distribution of rural communities, settlement growth patterns, and electricity demand. Zambia has also committed to achieving universal access to electricity by 2030 in line with SDG 7. Achieving this target requires an inclusive planning approach that considers all rural communities rather than focusing primarily on designated service centres.

Furthermore, advances in electrification technologies and planning methodologies have created new opportunities to expand electricity access through a combination of grid extensions, solar mini-grids, and standalone solar systems. Together with the availability of improved geospatial data and analytical tools, these developments made it necessary to update the REMP using a LCGEP approach, which enables a more comprehensive assessment of electrification options and provides a stronger framework for guiding investments aimed at achieving universal electricity access.

1.3. Main Objective of updating the REMP

The main objective of updating the REMP is to transform it into a dynamic and responsive planning framework that addresses current challenges and adapts to evolving developments in Zambia's rural electrification landscape, while guiding the achievement of universal access to electricity by 2030.

1.3.1. Specific Objectives of updating the REMP

The specific objectives of the update are as follows:

i. Review the concept of RGCs in relation to achieving the intended electrification access targets;
ii. Review and revise the initially proposed 1,217 RGCs listed in the 2008 REMP to include all unelectrified rural areas across the country;
iii. Reassess the previously recommended electrification methods for each RGC and determine whether they are still relevant and feasible for Electrification Areas;
iv. Adopt a LCGEP approach in identifying suitable electrification options for the rural communities;
v. Identify and propose appropriate electrification options for the identified Electrification Areas;
vi. Propose business models tailored to the targeted Electrification Areas, ensuring that the models are financially sustainable and suitable for long-term operation;
vii. Develop a suitable financing strategy for the implementation of the REMP; and
viii. Develop a Visualisation platform that provides access to the results of the REMP GIS database to support planning, coordination, and investment decision-making for Electrification Areas.

1.4 Scope of the Study

The REMP update covers rural areas across all provinces of Zambia. The study involved collecting and analysing demographic, socioeconomic, and geospatial data to identify communities without access to electricity and determine appropriate electrification options.

The analysis considered a range of electrification technologies, including grid development, solar mini-grids, and standalone solar systems. The study also assessed potential electricity demand, proximity to existing electricity infrastructure, and other factors influencing the feasibility of different electrification solutions.

The REMP provides a national-level planning framework to guide the expansion of electricity access in rural areas from 2025 to 2030.

1.5 Outline of REMP

This plan is organised into several chapters as follows:

i. Chapter 1: Introduction – Provides the background, rationale, objectives, and scope of the REMP update.
ii. Chapter 2: Policy and Sector Context – Reviews the national policies and institutional arrangements relevant to rural electrification.
iii. Chapter 3: Rural Electrification Framework - Presents the overall planning framework adopted in the REMP, including the transition from the RGC concept to the Electrification Areas approach.
iv. Chapter 4: Planning Approach and Methodology – Describes the analytical approach and data used in developing the REMP.
v. Chapter 5: Results and Findings – Presents the results of the geospatial electrification analysis and identifies electrification options.
vi. Chapter 6: Business Models - Outlines the proposed business and delivery models to support the implementation and long-term sustainability of electrification projects.
vii. Chapter 7: REMP Financing and Implementation – Outlines the estimated investment requirements and implementation mechanisms for achieving universal access to electricity.
viii. Chapter 8: Environmental and Social Safeguard Requirements - Highlights the environmental and social considerations associated with rural electrification projects and outlines the applicable safeguard requirements.
ix. Chapter 9: Role of Gender and Social Inclusion in Electrification Planning – Discusses the importance of gender equality and social inclusion in the planning and delivery of electrification programmes.
x. Chapter 10: Monitoring and Evaluation of Electrification Progress - Describes the framework for tracking implementation progress and measuring the impact of electrification interventions.
xi. Chapter: Conclusions and Recommendations – Summarises the key findings and provides recommendations for implementing the REMP.

CHAPTER 2. POLICY AND SECTOR CONTEXT

2.1. Policy, Legal Framework, and Strategies

Zambia's energy policy framework is guided by a series of policies, legislation, and strategies aimed at ensuring access to sustainable, reliable, and equitable energy for the country's population. The section highlights a narrative of the key components of Zambia's energy policy framework:

i. The Zambia Vision 2030

The Vision 2030 is Zambia's long-term plan, that reflects the country's collective understanding, aspirations, and determination to become a prosperous middle-income nation. It outlines the goals and targets for various economic sectors, as well as the challenges and obstacles to achieving these aspirations. The Vision 2030 is built on seven key principles:

a) Sustainable development;
b) Upholding democratic principles;
c) Respect for human rights;
d) Fostering family values;
e) Positive attitude towards work;
f) Peaceful coexistence; and
g) Upholding good traditional values.

Specifically, the vision for the Energy sector is to ensure universal access to clean, reliable, and affordable energy at the lowest total economic, financial, social, and environmental cost, in line with national development goals by 2030. One of the sector's goals is to ensure an abundant and reliable supply of affordable energy in peri-urban, and rural areas.

ii. National Development Plans

The National Development Plans (NDPs) operationalise the Vision 2030. NDPs serve as Zambia's medium-term blueprint, designed to unlock the country's potential across all economic sectors for sustainable, holistic, and inclusive national development. The Eighth National Development Plan (8NDP), covering the period from 2022 to 2026, outlines Zambia's strategic direction, development priorities, and implementation strategies, aiming to bring the country closer to its 2030 vision of becoming a prosperous middle-income nation.

It plays a crucial role in achieving this national vision. Among its goals, it emphasises increasing electricity generation capacity, promoting alternative green and renewable energy sources, and scaling up rural electrification.

iii. The National Energy Policy, 2019

The National Energy Policy of 2019 (NEP 2019) replaced the National Energy Policy of 2008, continuing and enhancing its objective of promoting private-sector participation in the energy sector. The NEP 2019 acknowledges the crucial role of the private sector in the ongoing growth of the electricity sector.

Consequently, the policy supports the development and deployment of renewable and alternative energy sources, promotes energy supply security through diversification at cost-reflective pricing, and aims to scale up access to energy services in both rural and urban areas. Furthermore, the NEP 2019 acknowledged the need to establish regulatory frameworks for off-grid systems.

iv. The Electricity Act No. 11 of 2019

The Electricity Act No. 11 of 2019 establishes the legal framework for the electricity subsector in Zambia. It regulates the generation, transmission, distribution, and supply of electricity, as well as the sale and purchase of electricity in Zambia. It aims to modernize and regulate the electricity sector by promoting competition, ensuring efficient and reliable electricity services, and protecting consumers' interests.

v. The Energy Regulation Act No. 12 of 2019

The Energy Regulation Act No. 12 of 2019 continues the existence of the Energy Regulation Board (ERB) as the Government body responsible for regulating the energy sector. The regulation of the sector is achieved primarily through licensing, economic and technical regulation, and compliance monitoring. The Energy Regulation Act ensures the effective development, operation, and management of Zambia's energy sector, balancing the interests of consumers, investors, and other stakeholders.

vi. The Rural Electrification Act No. 5 of 2023

The Rural Electrification Act No. 5 of 2023 continues the existence of the Rural Electrification Authority (REA), repealing and replacing the previous Rural Electrification Act No. 20 of 2003, which initially established REA. The 2023 act broadens the Authority's functions, assigning REA the role of coordinating rural electrification efforts with the private sector, NGOs, and other institutions. Additionally, REA is expected to provide technical guidance and consultancy services to state institutions, rural communities, and any other organisations involved in rural electrification.

vii. Integrated Resource Plan, 2023

The Integrated Resource Plan (IRP) for the electricity sub-sector serves as a blueprint for developing power projects at the lowest cost, aiming for energy sufficiency and surplus for the country. It offers a comprehensive and forward-looking plan to guide systematic development of electricity generation, transmission, and distribution infrastructure, using both on-grid and off-grid technologies.

The IRP emphasizes diversifying power-generation technologies and locations to enhance energy security and establish a reliable, cost-effective electricity framework. Residential demand is a key component of the IRP demand forecast, linked to UN SDG 7 and the need for social equity in facilitating universal access to electricity.

Further, the IRP has adopted a Social Safeguard Framework (SSF) with minimum standards to prevent negative social impact and increase socio-economic opportunities for targeted citizens in power projects.

viii. Statutory Instrument No. 41 of 2023

Statutory Instrument (SI) No. 41 of 2023, read together with SI No. 52 of 2024, exempts integrated electricity generation, distribution, and supply activities of 5 megawatts or less from regulation. However, these activities must still comply with environmental requirements, other applicable laws, and the guidelines set by the ERB.

ix. Renewable Energy Strategy and Action Plan (2022 –2030)

The Renewable Energy Strategy and Action Plan (RESAP) was developed by the MoE to guide the development of the country's renewable energy industry. The RESAP provides a roadmap for implementing the identified market interventions that will transform the market and catalyse the accelerated diffusion of renewable energy technologies.
The strategy promotes the Productive Use of Energy (PUE) in off-grid systems in rural areas by integrating them with economic activities to ensure sustainability.

x. Energy Efficiency Strategy and Action Plan (2022 –2030)

The Energy Efficiency Strategy and Action Plan (EESAP) was developed by MoE to support the systematic implementation of various Energy Efficiency (EE) measures. The EESAP highlights several EE activities that support the country in achieving the national target of sustainable energy development.

Proposed EE measures target various sectors, including residential, transport, and industrial. Additionally, the EESAP proposes various activities to ensure the EE market grows, helping to realise the set EE targets.

xi. Gender Equality Strategy and Action Plan (2022 –2030)

The overall objective of the Gender Equality Strategy and Action Plan (GESAP) is to enhance gender equality, social inclusion, and non-discrimination in all spheres of the energy sector.

The Strategy seeks to achieve gender and social parity in the development of the energy sector by addressing existing gender imbalances. Its implementation ensures equal opportunities for both women and men to actively participate, contribute to their full potential, and receive equitable benefits from the sector.

2.2. Key Stakeholders in the Rural Electrification Sector

The successful implementation of rural electrification initiatives relies on the coordinated efforts of various stakeholders, each playing a critical role in the energy landscape. The main stakeholders in Zambia's power sector are shown in Figure 1.

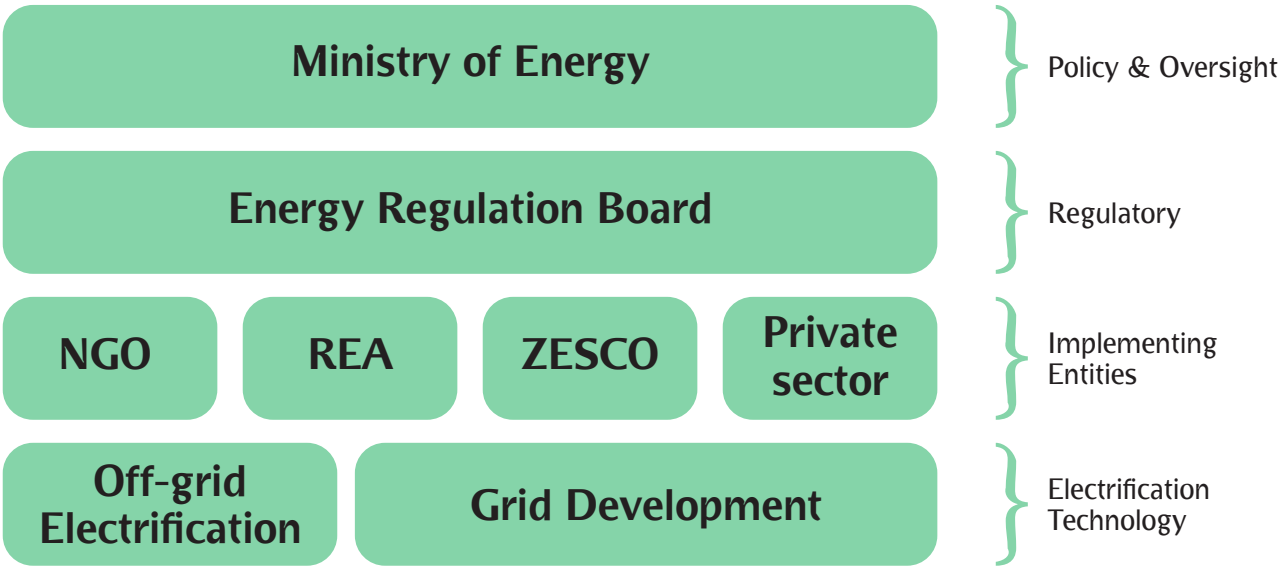

Figure 1: Key Stakeholders in the Rural Electrification Sector

[1] Energy Sector Report, 2023

i. Ministry of Energy

MoE is responsible for the sustainable development and management of energy resources for the benefit of the people of Zambia. It is responsible for overseeing strategic planning, implementation, and performance monitoring within the Energy Sector. Additionally, the MoE plays a crucial role in setting policies and facilitating activities in the Zambian energy sector.

ii. Energy Regulation Board

ERB is a statutory body established by the Energy Regulation Act of 1995, which was repealed and replaced by the Energy Regulation Act No.12 of 2019 of the laws of Zambia. The mandate of the ERB is to develop rules and regulations to govern the energy sector effectively.

The rules and regulatory frameworks provide guidelines for the conduct and performance of licensees, protecting the interests of consumers and stakeholders at large. The ERB carries out this mandate through consultation and collaboration with key stakeholders in the energy sector[1].

iii. Rural Electrification Authority

The Rural Electrification Authority (REA) was established by the Rural Electrification Act No. 20 of 2003, which has now been repealed and replaced by Act No. 5 of 2023, to provide electricity infrastructure in rural areas. The functions[2] of REA include:

a. Promote the utilisation of available rural electrification technological options to enhance the contribution of electricity for the development of social and economic activities in rural areas;
b. Develop mechanisms for the procurement of grid extension networks, on -grid and off-grid systems for rural electrification;
c. Recommend to the Government programmes and interventions for the enhancement of access to electricity by rural population;
d. Implement the rural electrification master plan in order to ensure the systematic electrification of rural areas;
e. Administer and manage the rural electrification fund;
f. Mobilise funds within and outside the Republic in support of rural electrification;
g. Procure the construction of rural electrification projects in accordance with the Public Procurement Act, 2020;
h. Design and offer developers or operators, on a competitive basis, smart subsidy for capital costs on projects that are designed to supply electricity for development of rural areas;
i. Finance project preparation studies for rural electrification projects in accordance with guidelines developed by the Authority;
j. Coordinate rural electrification with the private sector, non-governmental organisations, and other institutions; and
k. Provide technical guidance and consultancy services to a state institution, rural community and any other organisation involved in rural electrification.

[2]. Rural Electrification Act No. 5 of 2023

iv. ZESCO Limited

ZESCO Limited is a vertically integrated national electricity utility established under the Companies Act, with 100% of its shares owned by the Government through the Industrial Development Corporation (IDC).

ZESCO's operations span the entire electricity value chain, including generation, transmission, distribution, and supply. The utility is mandated to supply electricity and energy solutions within Zambia and the Sub-Saharan region. ZESCO is also a member of the Southern African Power Pool (SAPP), an association of public utilities and private power producers in Southern Africa.

ZESCO and REA collaborate in the planning of grid development projects that are to be implemented by REA. Once implemented, the grid development projects are handed over to ZESCO for Operations and Maintenance (O&M).

v. The Private Sector

The private sector plays an increasingly pivotal role in Zambia's Electricity Supply Industry (ESI), contributing significantly to generation, transmission, distribution, and the sector's overall development.

In Zambia's rural electrification efforts, the private sector is essential in providing investment and financing for projects. This support complements Government initiatives to expand electricity access in rural areas and accelerates the pace of electrification. Through public-private partnerships (PPPs), the private sector collaborates with the Government to share risks and benefits, ensuring sustainable project development.

Additionally, the private sector develops and implements innovative business models that ensure the sustainability of rural electrification projects, making electricity more accessible and affordable for rural populations.

2.3. Population Profile

The Zambia National Census of Population and Housing is conducted once every 10 years, as mandated by the Statistics Act No. 13 of 2018. The 2022 census, from which the current population and housing statistics are derived, marks the sixth census since Zambia gained independence in 1964.

Zambia's population has increased significantly, from 13.1 million in 2010 to 19.6 million in 2022. During this period, the population grew at an average annual rate of 3.4 percent, an increase from the 2.8 percent recorded in the previous decade. The rural population experienced an average annual growth rate of 3.4 percent between 2010 and 2022, increasing from 2.1 percent in the previous intercensal period. As a result, the rural population increased from 7,919,216 in 2010 to 11,766,114 in 2022.

According to the 2022 Population and Housing Census, the ranking of provinces by population size remained unchanged from 2010 to 2022, although each province experienced a gradual increase in population.

Lusaka had the largest population, growing from 2,191,225 in 2010 to 3,079,964 in 2022. It was followed by the Copperbelt, which increased from 1,972,317 to 2,757,539. Eastern Province saw growth from 1,696,555 to 2,454,788, while Southern Province expanded from 1,589,926 to 2,381,728. Central Province's population rose from 1,307,111 to 2,252,483, and Northern Province grew from 1,105,824 to 1,618,412. Luapula's population increased from 991,927 to 1,514,011, Western Province from 902,974 to 1,363,520, and North-Western from 727,004 to 1,270,028. Muchinga recorded the smallest population, growing from 607,763 in 2010 to 918,296 in 2022.

Further, the national population density increased from an average of 17.4 people per square kilometre in 2010 to 26.1 people per square kilometre in 2022. The population density across the 10 provinces shows significant disparity, with some provinces having high densities, such as Lusaka at 140.1 people per square kilometre in 2022, and others having much lower densities, such as North-Western Province at 10.1 people per square kilometre. Table 1 shows the population density per province by census year.

Table 1: Population Density by Province

PROVINCE	Population Density/Census Year (Population per sq.km)			
	Area Sq.km	2000	2010	2022
Zambia	752,612	13.1	17.4	26.1
Central	94,394	10.7	13.8	23.9
Copperbelt	31,328	50.5	63.0	88.0
Eastern	51,476	17.8	30.9	35.6
Luapula	50,567	15.3	19.6	29.9
Lusaka	21,896	63.5	100.1	140.1
Muchinga	87,806	6.0	8.1	13.1
Northern	77,650	10.5	14.2	20.8
North-Western	125,826	4.6	5.8	10.1
Southern	85,283	14.2	18.6	27.7
Western	126,386	6.1	7.1	10.8

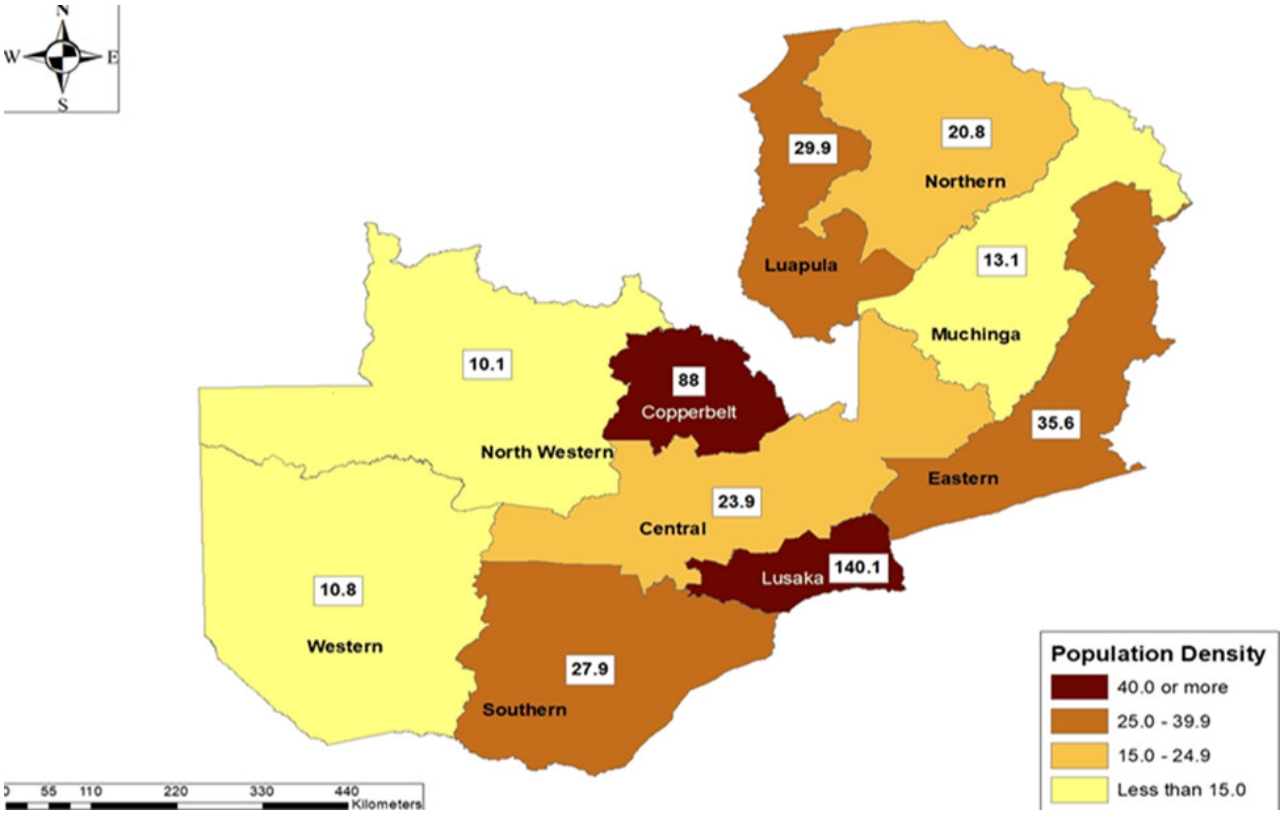

Figure 2: Census Population Density by Province

CHAPTER 3. RURAL ELECTRIFICATION FRAMEWORK

3.1. Introduction

This chapter presents the rural electrification planning framework adopted in the REMP. The framework builds on the experience gained from implementing the 2008 REMP and incorporates new planning approaches, technologies, and institutional developments in Zambia's energy sector.

The chapter begins by reviewing the approach used in the 2008 REMP, which relied on the RGC concept to guide rural electrification planning. It then explains the transition from the RGC-based approach to a more comprehensive planning framework that considers all unelectrified rural communities across the country.

The updated framework introduces the concept of Electrification Areas, which serve as the primary planning units for identifying electrification opportunities and selecting appropriate electrification technologies. The chapter also outlines key considerations that informed the development of the REMP, including investment strategies for universal access, business models for electrification expansion, gender and social inclusion, the definition of electricity access, digital planning tools, and coordination mechanisms for rural electrification initiatives.

3.2 The 2008 REMP Approach to Rural Electrification

The 2008 REMP adopted the RGC concept as the primary framework for rural electrification planning.

An RGC was defined as a rural locality characterised by a relatively high concentration of residential settlements and economic activities that serve surrounding communities. These centres typically host public facilities such as schools, health centres, markets, and trading centres that provide services to nearby villages. The RGC concept is illustrated in Figure 3[3] below.

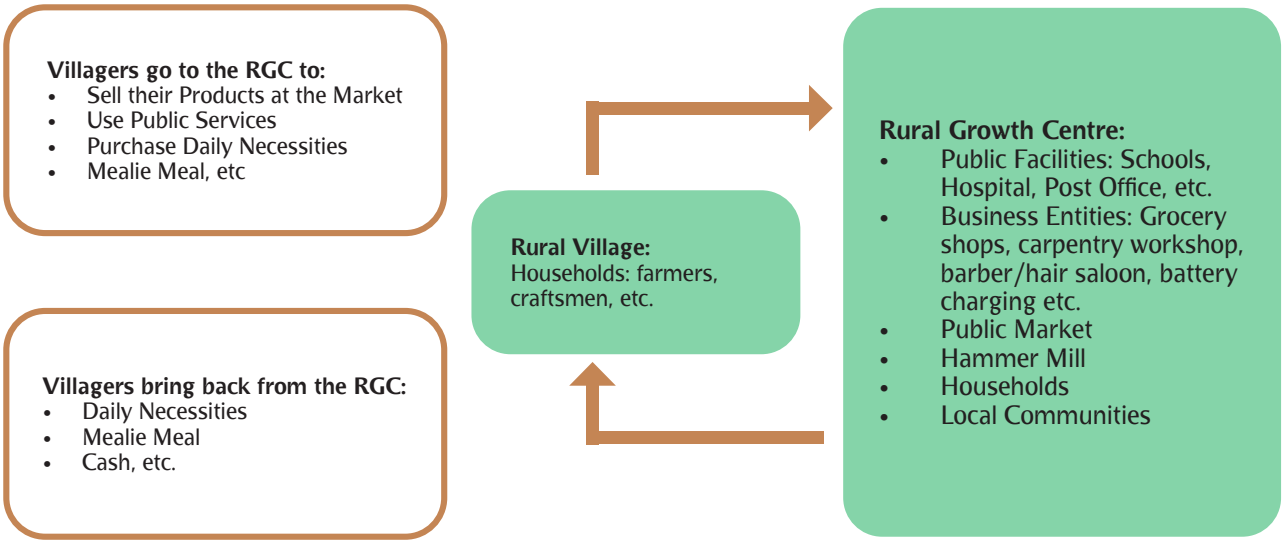

Figure 3: RGC Concept

[3] Rural Electrification Master Plan (REMP) 2008

A decentralised planning process was employed to identify 1,217 rural growth centres (RGCs) as targets for electrification. As part of the process, data collection sheets and topographic maps were shared with district planners to provide information on unelectrified RGCs that should be prioritised for electrification.

To compile a comprehensive list of unelectrified RGCs nationwide, data was gathered from all 72 districts. The study aimed to systematically record both electrified and unelectrified RGCs, including their demographic information and locations. Provincial and District Planners played a key role in identifying and prioritising unelectrified RGCs for electrification.

A total of 1,217 unelectrified RGCs were documented, and a priority shortlist for electrification was developed. Additionally, the top-ranked RGC in each district (except Lusaka, which is entirely urban) was selected for a socio-economic survey. In total, 71 unelectrified RGCs and 19 electrified RGCs were chosen for field research to support future electrification initiatives.

The potential daily peak demand for these RGCs was forecasted using their demographic data. Based on this potential peak demand, the RGCs were initially ranked. Using this ranking, project packages or clusters of RGCs to be electrified via transmission/distribution line extensions were created. The process began with the highest-ranked RGC, and unelectrified RGCs along the route to this priority RGC were grouped into project packages as candidates for electrification through line extension projects.

Each project package was subdivided into several components by reducing the length of the transmission/ distribution line extension and incorporating stand-alone electrification modes (such as mini-hydro, Solar Home Systems, or diesel generators) for the RGCs that the line could not reach. This process grouped the 1,217 unelectrified RGCs into 180 project packages. An optimal electrification mode was determined for each package. Based on the estimated costs for each package, the final electrification priority of the 1,217 RGCs across the 180 project packages was established using the Financial Internal Rate of Return (FIRR). Ultimately, these 180 project packages were grouped into 22 annual project phases extending up to 2030. The project package concept is illustrated in Figure 4[4] below.

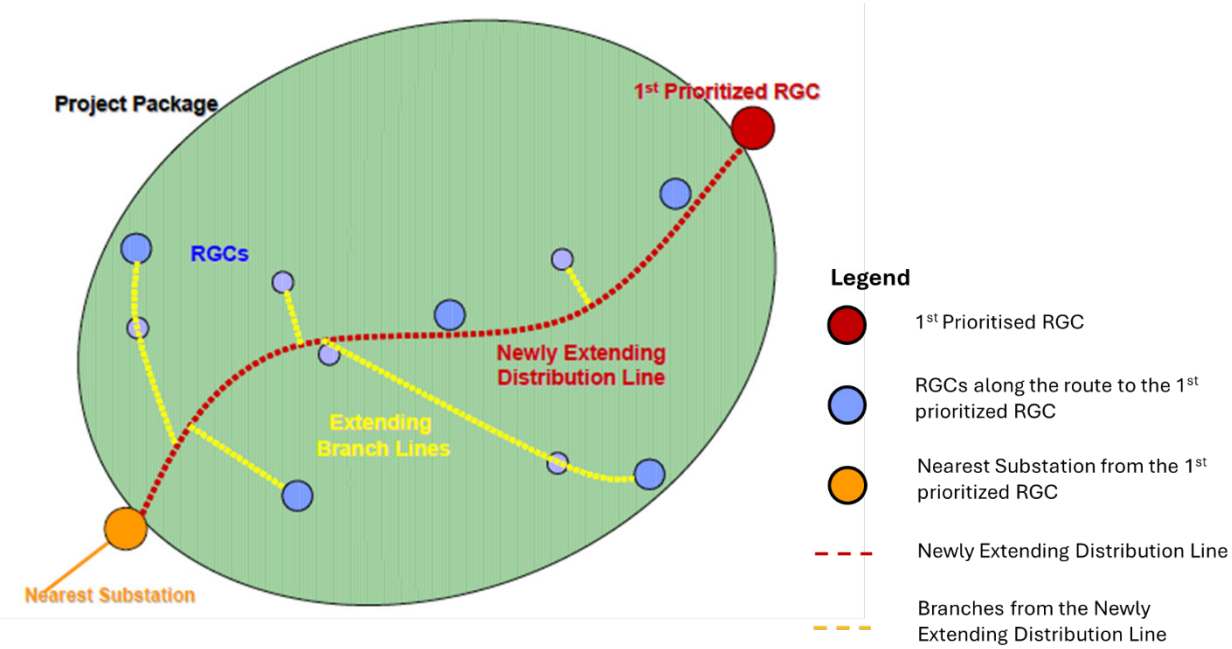

Figure 4: Project Package Concept

[3] Rural Electrification Master Plan (REMP) 2008

3.3. Transition from Rural Growth Centres to Electrification Areas

3.3.1 Rural Growth Centre Concept

The RGC concept provided a structured approach for prioritising electrification investments by focusing on rural service centres with relatively higher population densities and economic activities.

Electrification of these centres was expected to stimulate local economic development by supporting productive activities such as agro-processing, trade, and small-scale manufacturing. It was also anticipated that electricity access in these centres would gradually extend to surrounding settlements through the expansion of distribution networks.

While this approach helped prioritise electrification investments in the early stages of the REP, it focused primarily on specific rural centres rather than addressing the electrification needs of all rural communities.

3.3.2 Limitations of the Rural Growth Centre Approach

Although the RGC concept provided an important starting point for rural electrification planning, several limitations became apparent during the implementation of the 2008 REMP.

Firstly, the approach focused on electrifying selected rural centres rather than addressing the electrification needs of all rural settlements. Consequently, many communities located outside the identified RGCs remained without access to electricity.

Secondly, the electrification strategy relied heavily on grid extension as the primary electrification technology. In many cases, the anticipated expansion of electricity access from RGCs to surrounding villages did not materialise due to long connection distances, high infrastructure costs, and low household demand levels.

In addition, Zambia has experienced significant changes since the development of the 2008 REMP. These include the creation of new districts, population growth, evolving settlement patterns, and the emergence of new electrification technologies such as renewable energy mini-grids and standalone solar systems.

These developments highlighted the need for a more comprehensive planning approach capable of addressing the electrification needs of all rural communities across the country.

3.3.3 Expansion of the Planning Framework

As part of the REMP update process, the previously identified 1,217 RGCs were reviewed to assess their continued relevance in guiding rural electrification planning.

The review revealed that limiting electrification planning to these centres was insufficient to achieve universal electricity access. Consequently, the planning framework was expanded to include all unelectrified rural communities across Zambia.

In addition, the electrification technologies previously recommended under the 2008 REMP were reassessed using a LCGEP approach. This approach enables planners to identify the most suitable electrification option for each locality by considering factors such as population density, distance from existing electricity infrastructure, projected demand, and the cost of different electrification technologies.

Through this expanded framework, rural communities are grouped into Electrification Areas, which serve as the primary planning units for the REMP.

3.4. Key Aspects Considered for the REMP

The following are the key aspects for the REMP;

3.4.1. Investment Strategy to Support Universal Access

In 2015, universal standards were adopted through the United Nations (UN) Sustainable Development Goals (SDGs). SDG 7 is focused on ensuring access to affordable, reliable, sustainable, and modern energy for all. All UN member states adopted SDGs, and multilateral development banks have designated funding towards developing countries attaining SDG7 and the other SDGs.

The LCGEP established the least-cost mode of universal electrification for Zambia by 2030, using available inputs, including the locations of existing grid networks and costing algorithms that calculate the least-cost mode of electrification for each locality and household in Zambia. The plan considered four potential modes of electrification based on the principles of least cost connection per household and the service level required, namely through:

i. Grid densification: connecting the unelectrified households within areas that are already covered by the existing electricity grid;
ii. Grid extension: extending the electricity network to supply power to unconnected areas, thereby enabling new localities and households to access electricity;
iii. Mini-grids: installing renewable powered isolated electricity systems to power remote localities; and
iv. Solar Home Systems (SHS): individual supply systems, to ensure even the most remotely located households are electrified.

The national total investments required to achieve universal electrification amount to approximately US$2.929 billion, spread across the 2022-2031 investment periods. Further, the 2023 IRP outlines the investment required to attain universal access in rural areas by 2030 based on the cost estimates used in the LCGEP[5].

3.4.2. Business Models for Electrification Expansion

Business models are crucial in electrifying rural areas as they provide a framework and strategy for sustainable solutions. The REMP has proposed suitable business models for implementing projects in the targeted Electrification Areas. These business models ensure financial viability by generating sufficient revenue to cover operational costs and deliver returns on investment. They also include provisions for ongoing Operation and Maintenance (O&M) costs, which are essential for the long-term success of rural electrification projects. The plan has incorporated business models, including utility-owned (ZESCO), cooperative service territory, private mini-grid development, Public-Private Partnership (PPP), and private standalone solar models.

3.4.3. Gender and Social Inclusion in Electrification Planning

The Government has increasingly shown a commitment to women's economic and social empowerment and to integrating gender perspectives into its developmental agenda. Building on the adoption of the 2022 GESAP and the SSF for the energy sector, the REMP endeavours to champion gender and social inclusion in the implementation of rural electrification projects.

In view of this aspiration, the specific energy needs and potential barriers of women and other vulnerable groups will be considered in project design and implementation, ensuring that everyone can participate in and benefit from the project through access to electricity services and economic opportunities during the construction phase.

[5] Least-Cost Geospatial Electrification Plan for Grid and Off-Grid Rollout in Zambia

This includes the adoption of gender-responsive procurement, integration of cooking loads into mini-grids (a critical energy need for rural women due to roles traditionally assigned to them), mainstreaming of gender and social inclusion in the EIA and ESMP, employment quotas for targeted citizens, and targeted efforts to close the gender gap in connection rates between female-headed and male-headed households.

3.4.4. Defining Access to Electricity

The Government, like many other countries, responded to the SDG 7 initiative to achieve "universal access to modern energy services by 2030." The initial step was to define access to electricity clearly, aligning it with the Multi-Tier Framework (MTF)[6] approach presented in Table 2. The MTF approach to measuring access to electricity introduces a five-tier methodology based on energy attributes, including quantity, quality, affordability, and duration of supply.

Table 2: Multi-Tier Framework Matrix

			TIER 0	TIER 1	TIER 2	TIER 3	TIER 4	TIER 5
ATTRIBUTES	**Peak Capacity**	Power capacity ratings (in W or daily Wh)		Min 3W	Min 50W	Min 200 W	Min 800 W	Min 2 kW
				Min 12Wh	Min 200Wh	Min 1.0kWh	Min 3.4kWh	Min 8.2kWh
		OR Services		Lighting of 1,000lmhr/ day	Electrical lighting, air circulation, television and phone charging are possible			
	Availability (Duration)	Hours per day		Min 4 hrs	Min 4 hrs	Min 8 hrs	Min 16 hrs	Min 23 hrs
		Hours per evening		Min 1 hr	Min 2 hrs	Min 3 hrs	Min 4 hrs	Min 4 hrs
	Reliability						Max 14 disruptions per week	Max 3 disruptions per week of total duration < 2 hrs
	Quality						Voltage problems do not affect the use of desired appliances.	
	Affordability					Cost of standard consumption package of 365kWh/year < 5% of household income.		
	Legality						Bill is paid to the utility, pre-paid card seller or authorised representative.	
	Health & Safety						Absence of past accidents and perception of high risk in the future.	

[6] Beyond Connections Energy Access Redefined Conceptualisation Report

MoE adopted the following definition to guide measurement of access to electricity based on the MTF:

"a household is said to have access to electricity, if by any technology source, it receives at least 4 hours of electricity per day (or at least 1 hour of electricity per evening) or has a primary source of energy with the capacity to provide the task of lighting, phone charging, or powering a (3-49) w device."

3.4.5. Electrification Area Approach

The REMP has adopted a different concept from the RGC concept. The Electrification Area concept focuses on electrifying every rural area in Zambia, in line with the objective of achieving universal access to electricity by 2030. Rural areas earmarked for electrification are referred to as "Electrification Areas". The formation of these Electrification Areas was primarily based on "energy demand".

A methodology has been devised to tailor energy solutions to the unique socio-economic, geographical, and demographic characteristics of each Electrification Area. Various electrification technologies have been selected based on area-specific requirements and sustainability considerations. Furthermore, detailed data segmentation provides stakeholders with refined information on Electrification Areas, facilitating informed decision-making aligned with specific electrification goals.

3.4.6. The Visualisation Platform

The REA Visualisation Platform is designed to provide stakeholders with a clear and accessible presentation of the REMP. Its purpose is to guide investment decisions in the rural electrification space while also serving as a communication tool to share information on the electrification status of areas, when specific areas are scheduled for electrification, and the technologies that will be applied.

The Platform enables the management and analysis of geospatial and related datasets, presenting them through user-friendly maps, charts, tables, and dashboards. This ensures that stakeholders not only have the data needed for planning but also a transparent view of the status of electrification, timelines, and approaches. It is useful for tracking and presenting project-related information, including:

i. Existing infrastructure and recommended electrification technologies.
ii. The number of customers and average cost per customer.
iii. Estimated project costs and developer activity (whether an area is already assigned or open to new developers).
iv. Communication of electrification schedules and technology choices to all stakeholders.

The platform provides secure access to data enhancing both security and collaboration.

Key Features include;

i. Customisable visualisations: Interactive maps, layered data views, and dashboards that combine multiple data sources.
ii. Project management functions: Tools for planning, monitoring, and reporting project activities.
iii. Location-based analysis: Spatial applications that provide detailed, area-specific insights.
iv. Information sharing and communication: Clear updates on electrification timelines and technologies, ensuring all stakeholders remain informed and aligned.

Overall, the platform offers an accessible interface for stakeholders to visualise progress, identify gaps, share information, and support data-driven decision-making. Combining planning tools with transparent communication will strengthen collaboration across the rural electrification space and ensure that communities, developers, and policymakers are equally informed about electrification opportunities.

3.4.7. Rural Electrification Coordination Mechanisms

The Rural Electrification Act No. 5 of 2023 granted REA the mandate to coordinate and manage rural electrification efforts comprehensively. The REMP incorporates mechanisms and guidelines developed by REA to oversee rural electrification initiatives. To ensure the effectiveness of the formulated guidelines for coordinating rural areas, the procedure highlighted below will guide stakeholders intending to electrify rural areas;

i. **Project Identification**: A detailed list of Electrification Areas and proposed electrification options is provided in the Annexes of this plan, which stakeholders can use as a primary reference for identifying potential Electrification Areas. In addition, stakeholders may access the same information through the Visualisation Platform, which provides spatial access to the results of the REMP geospatial analysis and allows users to view Electrification Areas and proposed electrification options interactively. Entities intending to develop rural electrification projects are therefore expected to review the information provided in the REMP and conduct preliminary site assessments to determine the suitability of the identified locations before initiating the application process.

ii. **Application for Feasibility Study Rights**: After identifying suitable sites, developers must seek authorisation from MoE to conduct feasibility studies through the Single Licensing Platform, depending on the type of project. Entities intending to electrify rural communities using Solar Home Systems (SHS) are expected to inform REA and submit project implementation reports to facilitate coordination in rural electrification.

iii. **MoE Due Diligence**: After receiving the application for feasibility study rights for a rural electrification project via the single licensing online platform, MoE conducts due diligence by notifying REA. REA will then verify the proposed site against the REMP and review the project details, including the project location, the technology to be used, the anticipated capacity, the target beneficiaries, and the community agreements. Based on this verification, REA will issue a no-objection letter if the project meets the required criteria. The validity of this no-objection will align with the specified period for the feasibility study rights granted by the MoE.

iv. **Feasibility Study Approval**: Once MoE receives feedback and comments from REA, including the no-objection letter, the feasibility study rights are granted to the developer. The developer is then authorised to conduct the feasibility study on the approved site. According to the Service Delivery Service Charter for MoE, feedback is provided to the developers within 28 working days. Upon completion, the developer must submit the feasibility study report to MoE for review and approval. MoE, in collaboration with REA, will assess the report to ensure the project's technical, economic, and social viability before granting final approval for the next phase of the project. In case of a rejection, REA will recommend alternative sites from the REMP for the developer's consideration.

v. **Implementation Agreement**: Following the Feasibility Study Approvals, the procurement process of a developer is finalised by the signing of an Implementation Agreement (IA) between MoE and the successful developer. The IA is an umbrella document that initiates negotiations and interactions with other government agencies to obtain approvals, permits, rights, licenses, waivers, and incentives.

vi. **Regulatory Approvals and Permits**: Developers must secure all relevant approvals, including local authority clearances, environmental approvals from the Zambia Environmental Management Agency (ZEMA), water rights from the Water Resources Management Authority (WARMA), land titles from the Ministry of Lands and Natural Resources (MLNR), and protection of cultural and archaeological sites from the National Heritage Conservation Commission (NHCC). Approval must be obtained from the Road Development Agency (RDA) and Zambia Railways Limited when projects intersect with inter-territorial or territorial roads or cross a railway line.

a. Zambia Environmental Management Agency

ZEMA, created under the Environmental Management Act No. 12 of 2011, is the main body responsible for regulating and coordinating environmental matters in Zambia. Its role is to protect the environment, manage natural resources sustainably, and oversee environmental conservation. Any development that could affect the environment must be approved by ZEMA through an Environmental Impact Assessment (EIA), submitted either as an Environmental Project Brief (EPB) or an Environmental Impact Statement (EIS), depending on the project type.

b. Water Resources Management Authority

The Water Resources Management Authority (WARMA), established under the Water Resources Management Act No. 21 of 2011, is responsible for protecting and managing Zambia's surface and groundwater. It oversees how water is used, shared, and developed to ensure sustainability. WARMA also issues water permits to power developers who need to use water from inland sources, in accordance with established procedures and timelines.

c. Ministry of Lands and Natural Resources

The Ministry of Lands and Natural Resources (MLNR) manages land and natural resources in Zambia. The Lands Act (Chapter 184) guides the process of issuing land leases for state or titled land. In Zambia, land is allocated in two main ways: State land is managed by the MLNR, and Customary land is overseen by traditional leaders. Customary land can be converted to state land if the traditional leader provides written consent, which is submitted through the local council to the MLNR. Once approved, the Ministry can issue a certificate of title.

Under the Lands and Deeds Act (Chapter 185), any land lease longer than 12 months must be registered with the Lands and Deeds Registry. Unregistered leases may be invalid in legal disputes. For power projects, developers must follow all land laws and procedures outlined in the Lands Act, just like any other development.

d. National Heritage Conservation Commission

The National Heritage Conservation Commission (NHCC) is responsible for protecting Zambia's heritage sites, national monuments, and historical landmarks. It was established under the National Heritage Conservation Act (Chapter 173) of the Laws of Zambia.

If a development project is planned in or near a heritage site, the developer must apply for a permit under Section 37 of the Act. While disturbing heritage sites is generally prohibited, Section 41 of the Act allows certain engineering activities to take place under specific conditions.

e. Road Development Agency

The Road Development Agency (RDA) was established under the Public Roads Act No. 12 of

2002 and became operational in 2006. Its main role is to construct, maintain, and manage public roads in Zambia. The Agency also regulates the maximum weight limits allowed on roads, among other responsibilities. Approval must be obtained from RDA in instances where projects intersect with inter-territorial or territorial roads.

f. Zambia Railways Limited

The Zambia Railways Limited (ZRL) was established under the Railways Act of 1984 to operate both rail passenger and freight trains. The company provides import, local, export and transit rail transportation services. Approval must be obtained from ZRL when projects cross a railway line.

vii. **Construction Permit**: After signing the IA with MOE and obtaining the necessary regulatory approvals, developers must apply for a license from the ERB for generation capacity above 5MW to establish and operate the project, in line with SI 41.

viii. **Project Implementation**: During this stage, developers will be required, through applicable agreements and coordination guidelines, to submit quarterly progress reports to REA, providing detailed updates on key milestones, technical challenges, and overall project progress.

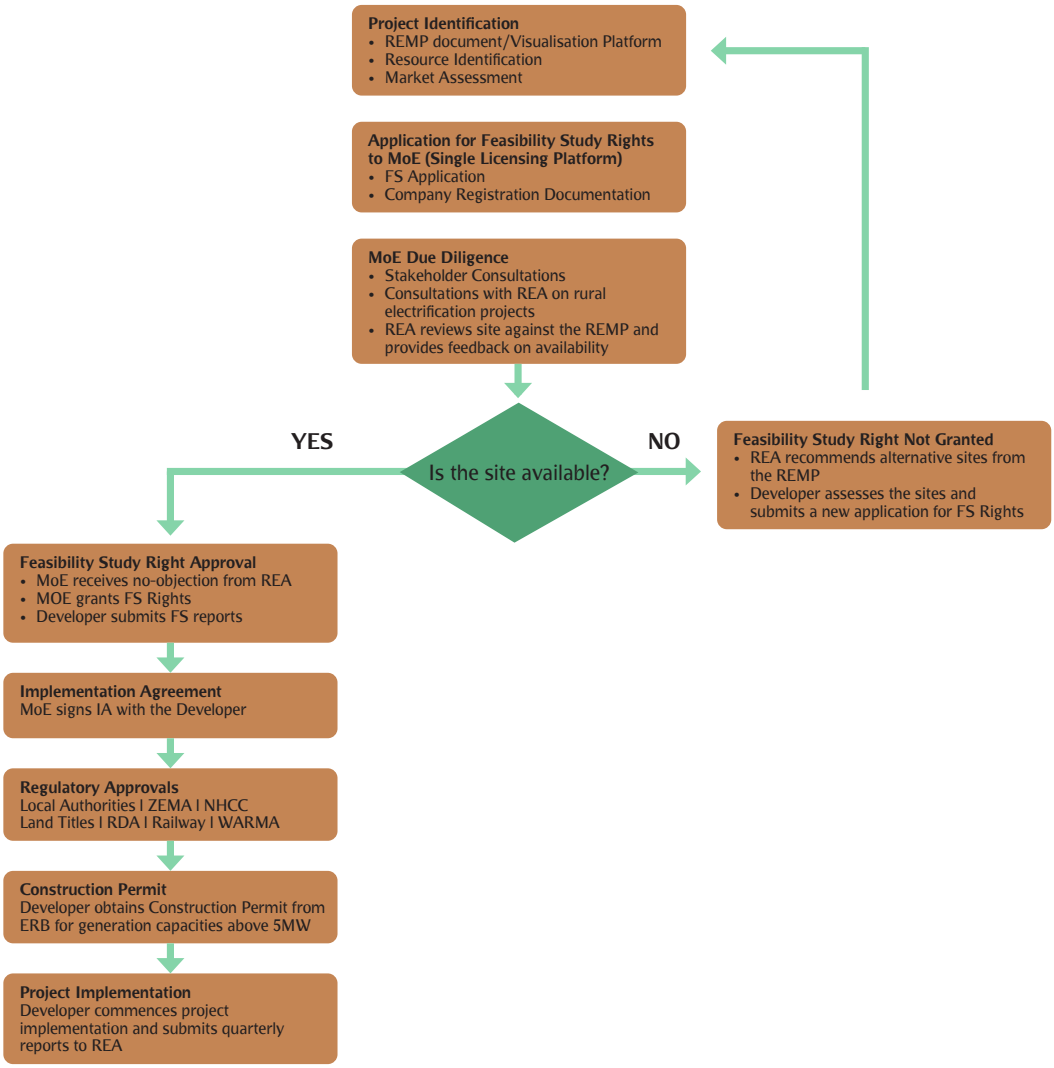

Figure 5: Private Developer Application Process for Rural Electrification Projects

3.4.8. Funding Mechanisms for Rural Electrification

Since 2003, REA has been a Special Purpose Vehicle (SPV) of the Government for managing the Rural Electrification Fund (REF) and implementing the REP in Zambia. As per the Rural Electrification Act No. 20 of 2003, the REF had three sources of funding: Money appropriated by Parliament on an annual basis, the 3% electricity levy from ZESCO and Loans and donations.

In 2023, the Rural Electrification Act No. 20 of 2003 was repealed and replaced by the Rural Electrification Act No. 5 of 2023, which continued the REF's existence. The sources of funding were expanded to four categories: monies appropriated by Parliament for the Fund; revenues received from the 3% electricity levy; grants or donations; and any other monies that vest in or accrue to the Fund. Figure 6 illustrates the structure and flow of funds under the REF.

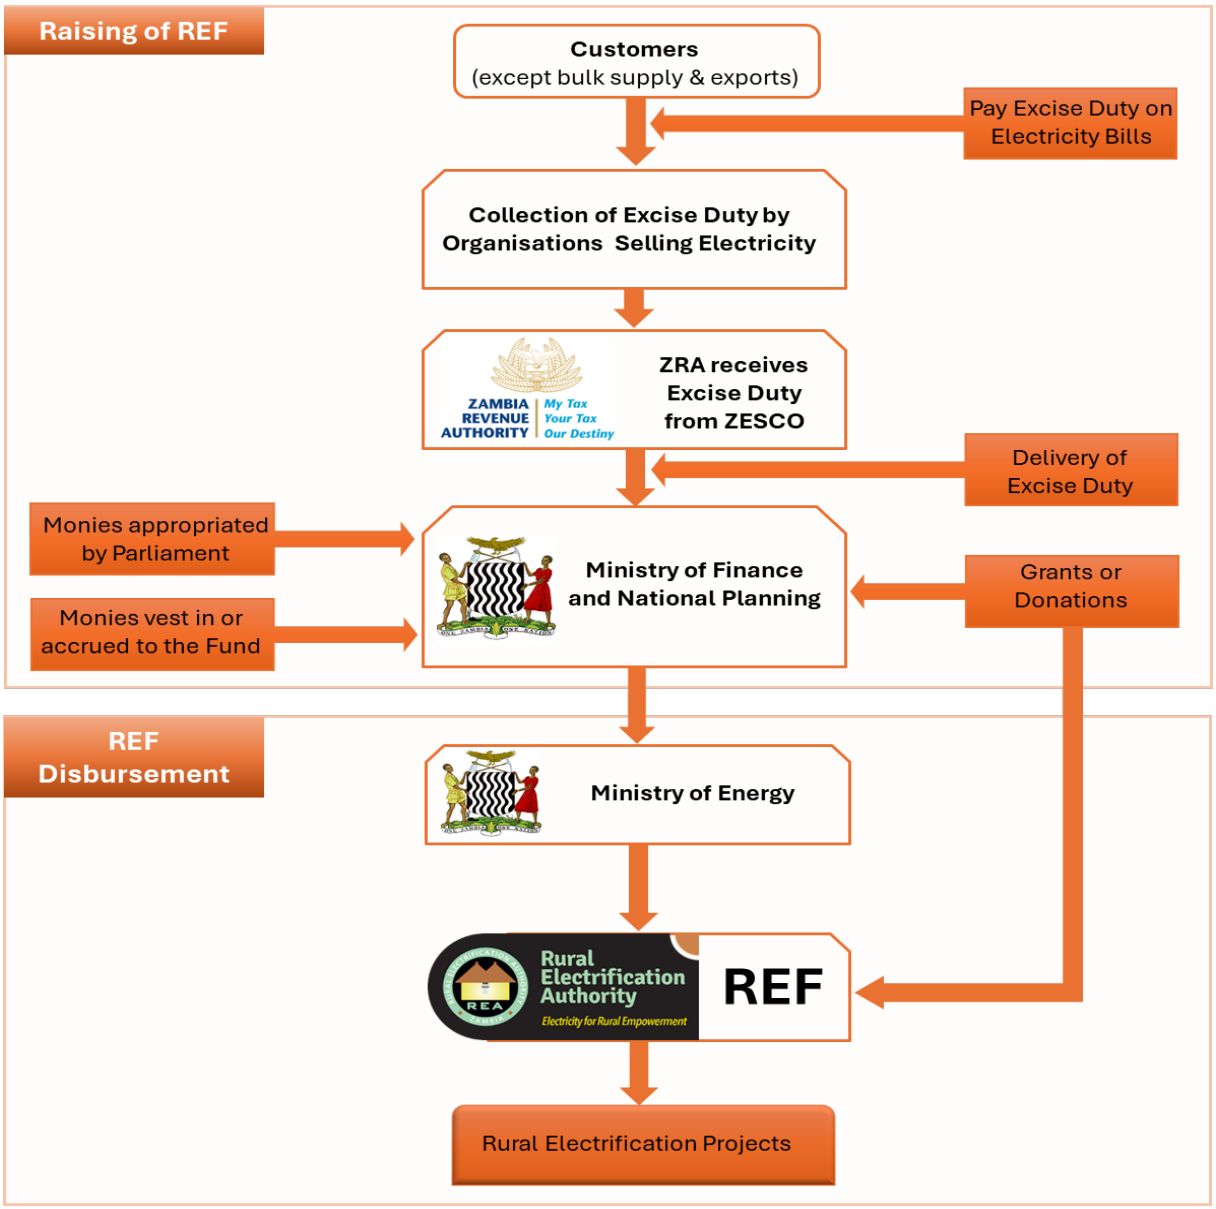

Figure 6: REF Flow Chart

CHAPTER 4. PLANNING APPROACH AND METHODOLOGY

4.1 Overview of the REMP Update Process

The REMP update involved a comprehensive analytical process to identify the most suitable electrification solutions for unelectrified rural communities across Zambia. The process combined geospatial analysis, electricity demand modelling, and least-cost electrification planning techniques to determine optimal electrification technologies for different areas.

The process began with the compilation and validation of datasets obtained from various national sources, including demographic and settlement data from ZamStats, electricity infrastructure data from ZESCO, and information from national development reports. These datasets were integrated into a geospatial database to support spatial analysis and electrification planning.

As part of the update process, the existing MV electricity network obtained from ZESCO was reviewed and validated through ground-truthing exercises to ensure accuracy and consistency. The analysis then assessed the electrification status of the RGCs identified in the 2008 REMP and expanded the planning scope to encompass all unelectrified rural settlements nationwide.

Following this assessment, unelectrified settlements were grouped into Electrification Areas based primarily on energy demand characteristics and spatial distribution. For each Electrification Area, suitable electrification technologies were evaluated using a LCGEP approach. The process resulted in the identification of optimal electrification solutions, estimated investment requirements, and implementation timelines for achieving universal electricity access.

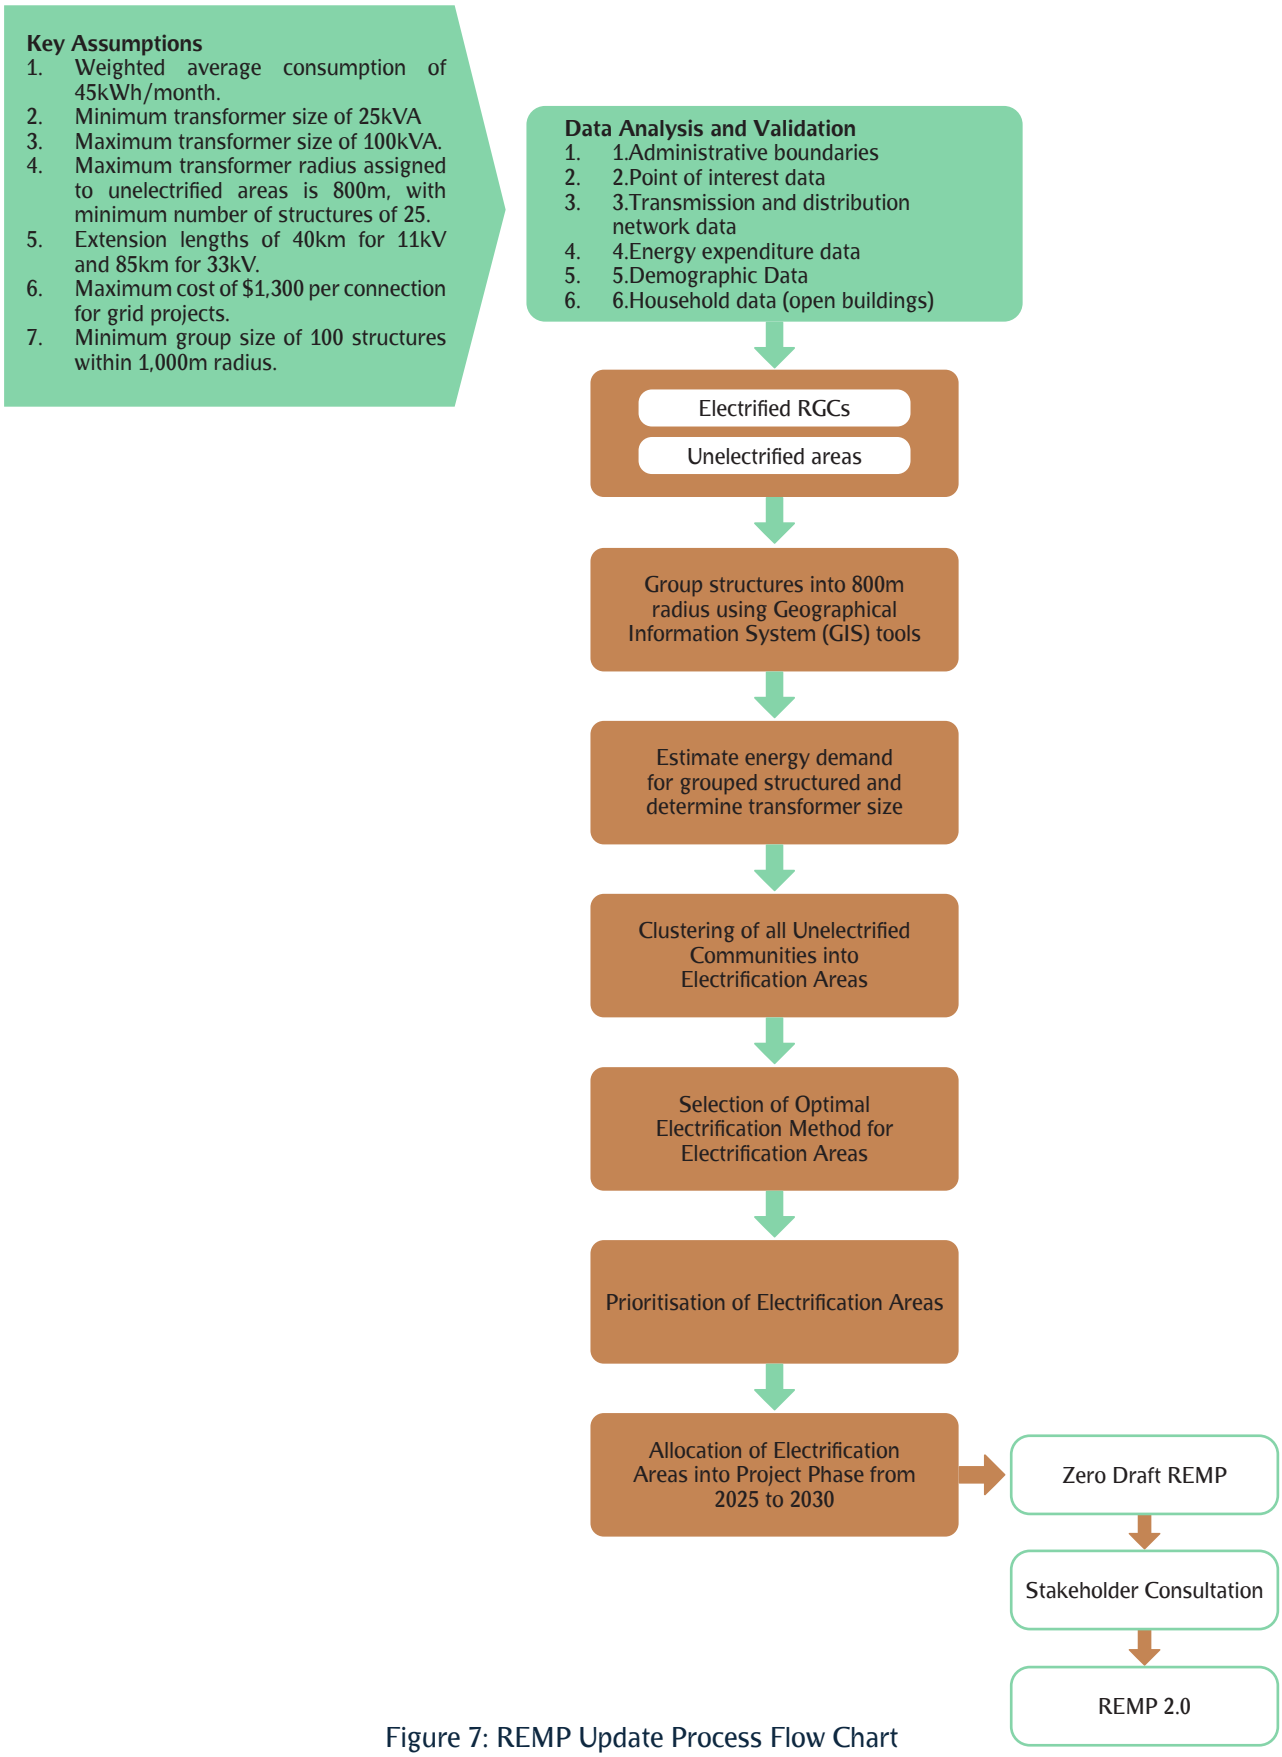

Figure 7: REMP Update Process Flow Chart

4.2. Data Sources and Collection

The development of the REMP relied on a variety of spatial, demographic, infrastructure, and cost datasets obtained from multiple institutions and public data sources. These datasets were integrated into a geospatial database to support electrification planning and modelling.

Key datasets used in the analysis include the following:

i. Distribution Network Data: This included the locations and characteristics of grid substations, medium voltage line alignments and conductor characteristics, distribution transformer locations and capacities, and other device locations and characteristics such as capacitor banks, voltage regulators, and switches, among others. The data was collected from ZESCO and updated through a field data collection process conducted on the ZESCO network;
ii. Road Network Data[7]: Primary and secondary road networks were used to identify transportation routes and guide routing algorithms used in the design of distribution networks;
iii. Housing Structure Data: Housing structure locations were obtained from the Google Open Buildings Dataset and converted into a digital point dataset for geospatial analysis;
iv. Population data: Population figures by political jurisdiction were based on the 2010 national census conducted by ZamStats and projected to 2024;
v. Administrative Boundary Data: This data was collected from ZamStats, including provinces, districts, constituencies, and wards;
vi. Water Bodies: Data on lakes and rivers were digitised from satellite imagery[8];
vii. National Parks and Protected Areas: The locations and boundaries of national parks and other protected areas were also digitised using satellite imagery as well as publicly available geospatial datasets;
viii. Electricity Consumption Data: Average consumption data from residential and commercial consumers was derived from a combination of ZESCO commercial data and energy expenditure surveys for unelectrified communities;
ix. Distribution Design Parameters: These parameters for medium and low voltage network expansion were evaluated and defined for the REMP; and
x. Cost Projections: Projections were made for grid network expansion (for both medium and low voltage network additions), mini-grids, and standalone solar systems. Additionally, cost data was gathered for service connections and meters for newly connected consumers.

4.3. Modelling Demand for Electricity Service

The principal challenge in national electrification analysis is determining how to expand electrification services using multiple technology solutions for rural and remote communities in the absence of demand data. Electrification planning has shown that electricity demand is correlated with population density. Areas with higher concentrations of housing structures tend to exhibit higher potential for electricity consumption and demand[9].

To support the demand analysis, a dataset of housing structures across Zambia was obtained from the Google Open Buildings dataset and processed within a geospatial database environment, as illustrated in Figure 8.

7. https://www.map.gov.zm
8. https://earth.google.com/web
9. https://www.oxfordenergy.org/wpcms/wp-content/uploads/2025/01/Global-electricity-demand.pdf

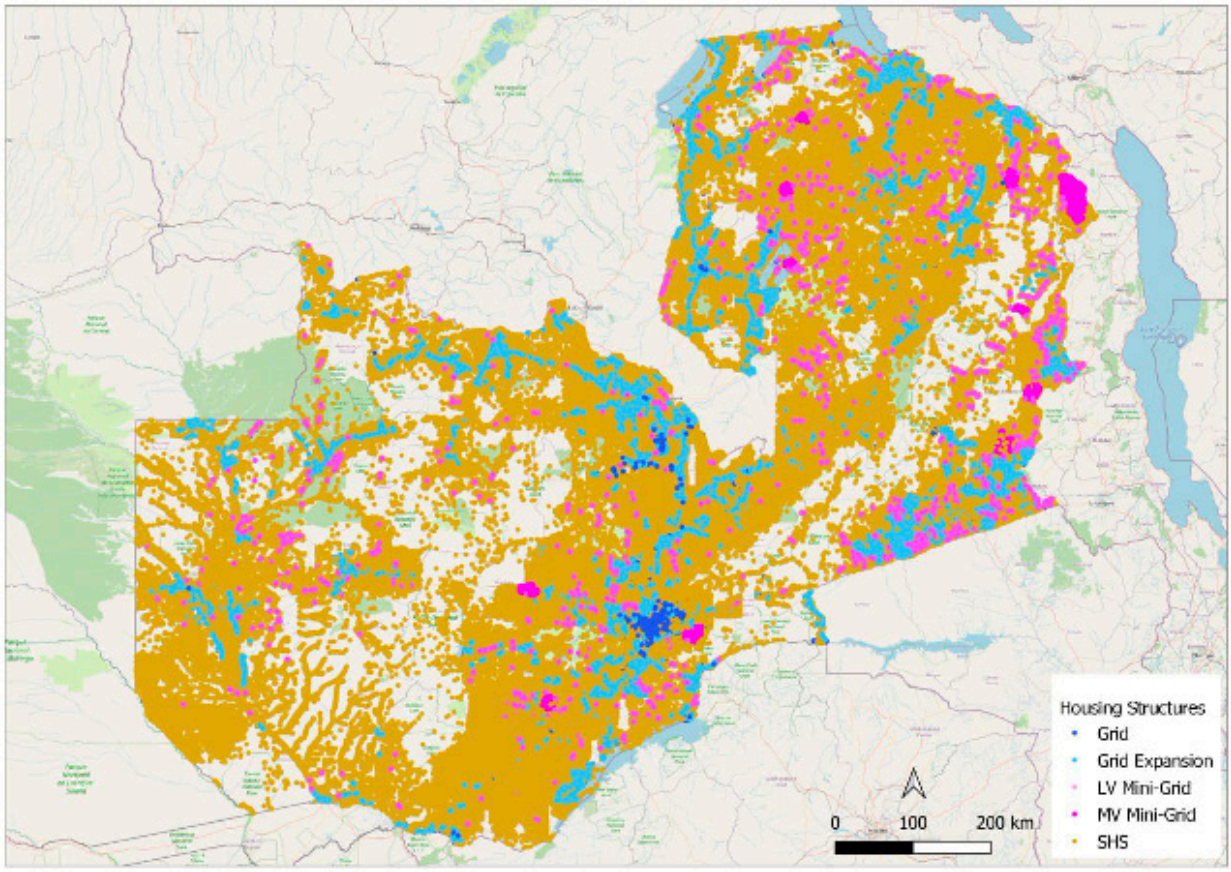

Figure 8: Illustration of housing structure data layer used to evaluate demand in electrification analysis.

Energy expenditure surveys conducted in unelectrified communities were also used to estimate the resources households allocate to meeting their energy needs through alternative sources, such as kerosene, dry-cell batteries, solar products, and other electricity substitutes. These expenditure patterns provide important insights into the potential demand for electricity once access is provided.

The combination of housing concentration and estimated energy expenditures provides the basis for evaluating electricity demand for housing clusters nationwide.

4.3.1 Clustering Process

The combination of housing concentration and expected energy expenditure levels is the primary basis for clustering housing structures that can be served by the placement of distribution transformers and interconnected by MV feeders to provide electricity service.

The clustering process is managed by an algorithm that runs in a geospatial database. The algorithm's output is a revised housing structure data layer for electrification analysis, in which housing structures are clustered into polygons with radii of 800 meters or less. Each cluster is evaluated for the number of housing structures and then used to estimate maximum demand (in kW) and projected monthly electricity consumption (in kWh). The maximum demand is used to determine the size of the distribution transformer to serve the housing cluster, assuming that the initial demand should be at least 30-35% of the transformer capacity, and the projected ten-year demand should not exceed 80% of the transformer capacity. Figures 9 to 11 illustrate how housing structures are aggregated into clusters and then evaluated for demand to dimension transformer capacities.

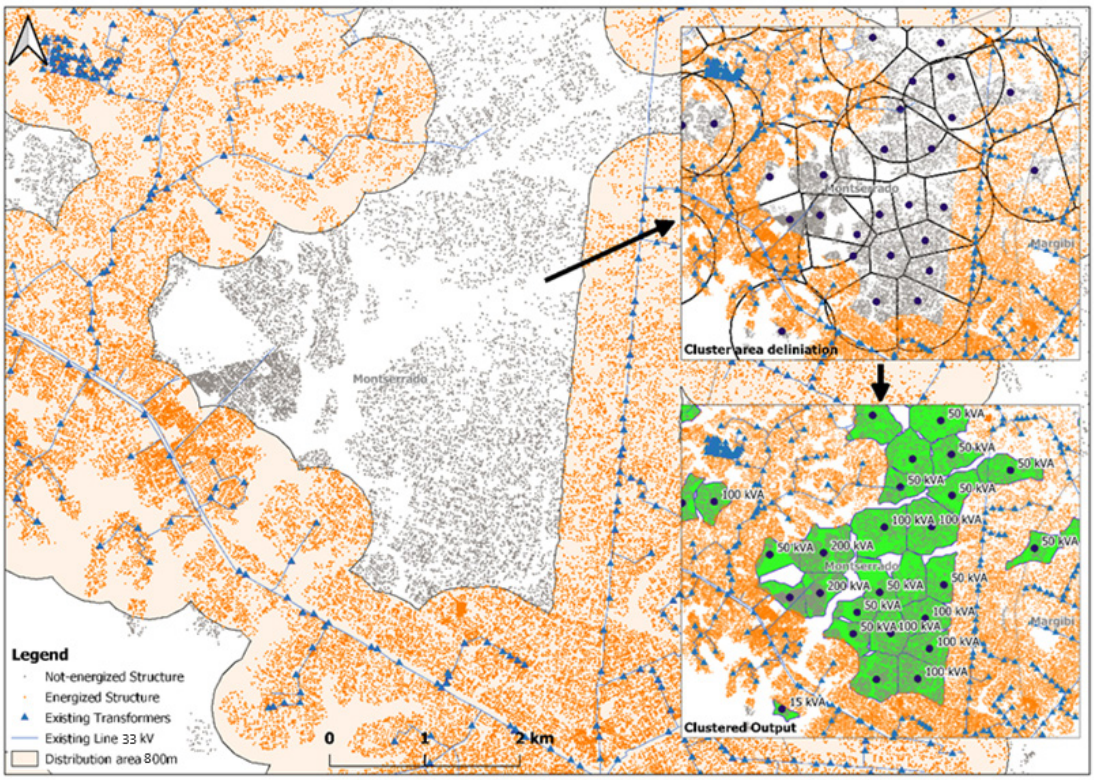

Figure 9: Delineate structures within a defined radius of the centroid of each housing cluster.

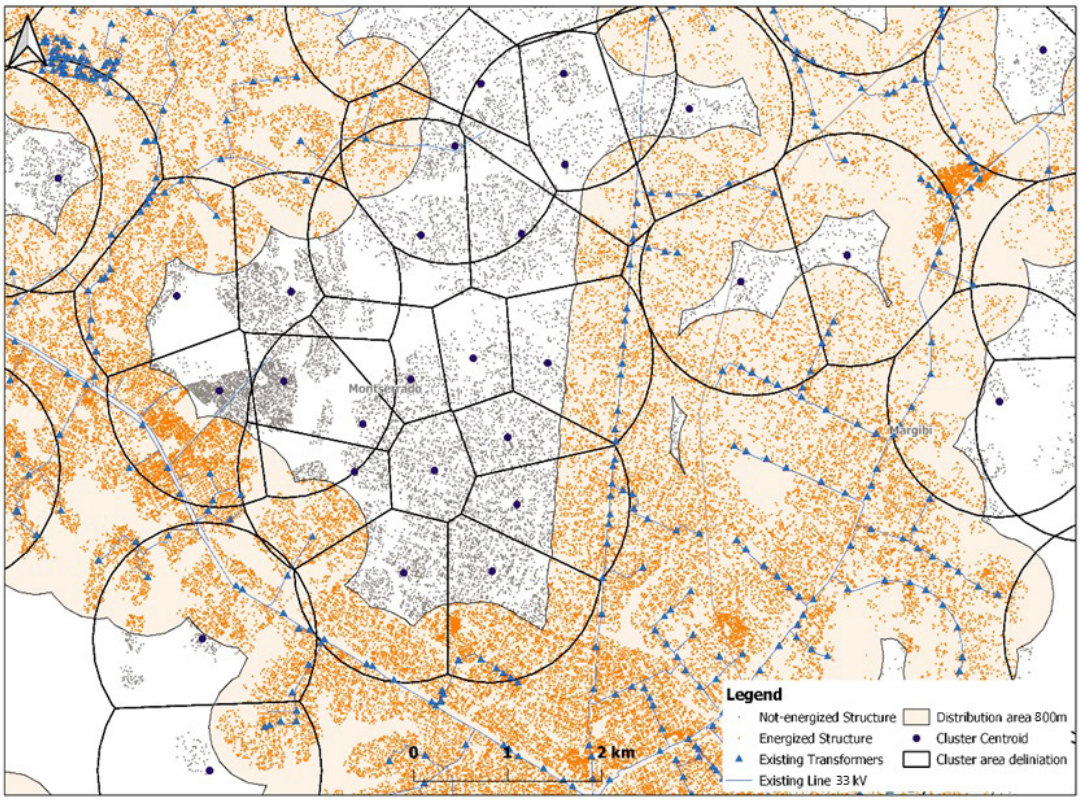

Figure 10: Cluster housing structures beyond radius of influence of existing transformers, locate new transformers.

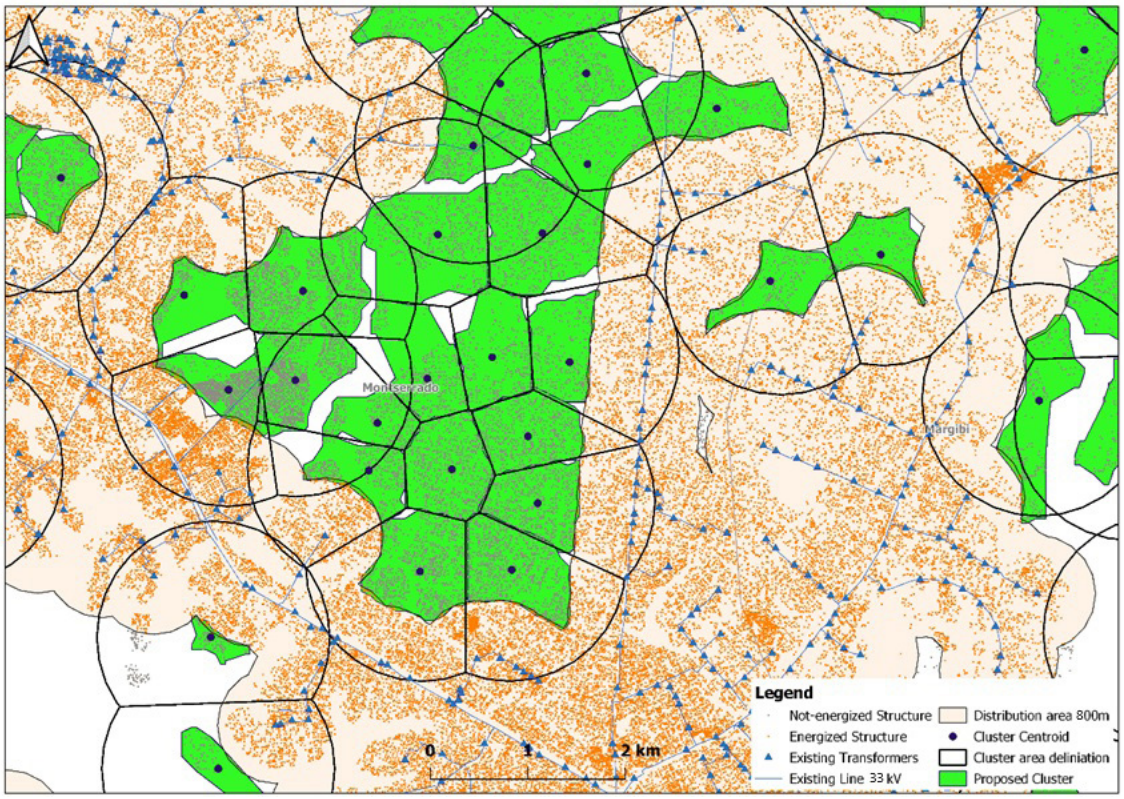

Figure 11: Evaluate number of structures to be served, dimension transformers (kVA).

4.4. Identifying and Evaluating Grid Development Projects

Once housing structures have been clustered and demand is estimated from monthly energy consumption, distribution transformers that may serve the structures in each cluster can be configured to evaluate grid development projects. This process follows several specific steps to define and evaluate individual projects.

The steps are as follows:

i. Using road network data and the location of each distribution transformer, the most effective pathway to interconnect housing structures to distribution transformers via 3-4 low-voltage feeders is evaluated using a routing algorithm. This step defines the LV network for each distribution transformer.

ii. The next step is to define the MV network needed to connect distribution transformers to medium voltage feeders. The routing algorithm is applied to interconnect distribution transformers to the existing ZESCO MV network via MV feeders or lateral interconnecting lines. This task is performed in accordance with the approved design guidelines.

iii. After line routing has been completed, each individual project – meaning, each line extension that is used to connect one or more distribution transformers and their individual LV circuits is evaluated for project cost. Project cost components include new MV line extensions, the number and size of distribution transformers, new LV networks connected to each new distribution transformer, and service connections and meters for all houses served by each project.

iv. For projects that exceed US$1,300 per consumer, these projects will be evaluated as mini-grids, assuming that the radius from the geographic centroid of the group of clusters to the outer limit is 1,000 meters. The minimum mini-grid size considered for the REMP mini-grids is 100 housing structures. Further, the maximum cost per consumer of US$1,300 for grid development projects is based off projects implemented by REA.

v. Evaluate all remaining structures that are not considered for grid development or mini-grid projects as standalone solar electrification solutions.

Figure 12 illustrates the ZESCO distribution network data layer, which was geographically mapped during the REA survey conducted in April-May 2024. This data was used to support the grid and off-grid development planning. This network database includes detailed information on all ZESCO 11 kV and 33 kV rural feeders, distribution transformers, grid substations, and ZESCO and private power stations.

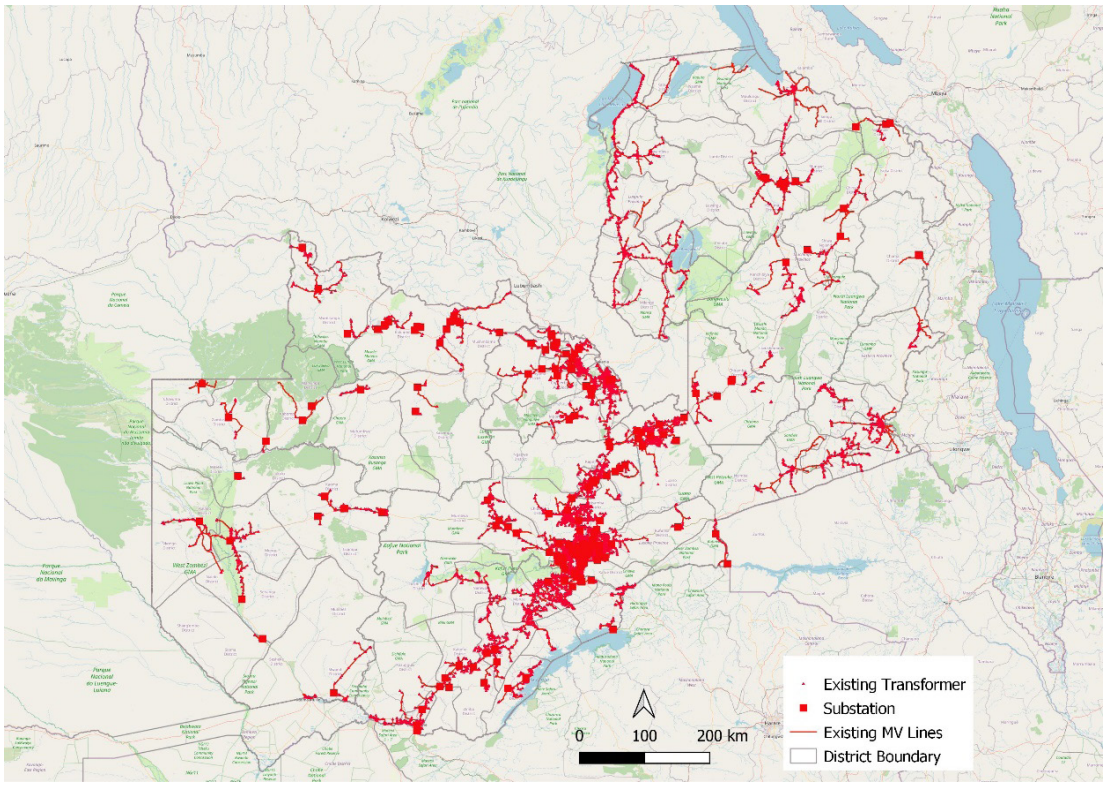

Figure 12: ZESCO MV distribution network data.

4.5. Cost Assumptions for Electrification Projects

Project characteristics are governed by projected electricity consumption, the consumer mix within each category, the growth of consumers to be served in each project, the components needed in the distribution network to serve newly connected consumers, and the cost of network expansion. These input data fields were evaluated using a combination of commercial data from ZESCO, field survey results from unelectrified communities, REA construction data, and growth projections.

Table 3 presents the consumer mix derived from ZESCO's commercial data resources. Note that over 90% of existing ZESCO consumers are residential, with the remainder primarily small commercial users. Less than 1% of all consumers fall under the small industrial consumers category. Table 3 presents the consumption and growth characteristics of consumers modelled for electrification expansion projects.

Table 3: Consumer mix used in grid development modelling.

Consumers	Value
Residential	90.61%
Commercial	8.51%
Medium Industrial	0.88%
Total	**100.00%**

Table 4: Consumption characteristics for residential, small commercial and industrial consumers

	Year 1	Growth years 2-5	Growth years 6-10
Residential, kWh/month	19	2.0%	2.0%
Commercial, kWh/month	39	2.0%	2.0%
Medium industrial kWh/month	275	2.0%	2.0%
	Year 1	Year 5	Year 10
Weighted average, kWh/month	23	25	27
Penetration	Year 1	Years 2 - 5	Years 6-10
Residential	40%	60%	70%
Commercial & Institutional	70%	75%	82%
Medium Industrial	90%	95%	100%

Tables 5 and 6 below present the cost characteristics of the grid development project for the 33kV and 11kV systems. Table 7 presents the cost characteristics for feeders and service drops. These cost estimates were based on REA-financed electrification projects.

Table 5: 33kV Grid development cost characteristics.

Distribution components	Type/Size	Cost (US$)
Three-Phase MV Feeders	OHL ACSR (100mm2)	18,862/km
Three-Phase MV Feeders	OHL ACSR (50mm2)	14,470/km
Distribution Transformer (33/0.4)	50kVA	7,800/unit
Distribution Transformer (33/0.4)	100kVA	9,400/unit
Distribution Transformer (33/0.4)	200kVA	12,400/unit

Table 6: 11kV Grid development cost characteristics.

Distribution components	Type/Size	Cost (US$)
Three-Phase MV Feeders	OHL ACSR (100mm2)	15,454/km
Three-Phase MV Feeders	OHL ACSR (50mm2)	11,044/km
Distribution Transformer (11/0.4)	50kVA	4,600/unit
Distribution Transformer (11/0.4)	100kVA	6,500/unit
Distribution Transformer (11/0.4)	200kVA	9,425/unit

Table 7: Grid development cost characteristics for Feeders and Service Drop.

Distribution components	Type/Size	Cost (US$)
Three-Phase LV Feeders	OHL ABC (50x3+50)	10,235/km
	OHL ABC (25x3+25)	7,030/km
Three-Phase Service Drop	OHL Quadruplex (16mm2)	270/unit
Single-phase Service Drop	OHL Duplex (10mm2)	135/unit

Table 8 presents projected costs for mini-grid components. These figures were derived from benchmark data shared by the World Bank and other resources, as reviewed in publications by ESMAP [10] and RMI [11].

Table 8: Mini-grid cost characteristics

System Component	Units	Cost Component (US$)
Solar PV Generation		
PV Modules	US$/W	0.276
PV Racking (Ground Mount)	US$/W	0.210
PV Inverters (String Inverters)	US$/W	0.116
Solar Installation Costs (Labor + PM)	US$/W	0.180
Solar Balance of System (BOS)	US$/W	0.060
Solar Logistics	US$/W	0.050
Total Solar Installed Costs	US$/W	0.892
Battery Energy Storage (BESS)		
Batteries (LFP, including Racks)	US$/kWh	396
Battery Inverter (PCS)	US$/W	0.22
Battery Installation Costs (Labor + PM)	US$/W	0.08
BESS Balance of System (BOS)	US$/W	0.06
BESS Logistics	US$/W	0.04
Total Battery Installed Costs	US$/kWh	496

4.6. Grid Development Planning

Using the results of the clustering analysis to identify high-density housing clusters that can be served by distribution transformers and applying the routing algorithm to evaluate the most cost-effective low voltage and medium voltage line alignments, as well as applying the unit costs summarised above, the grid development solutions can be identified and evaluated. Grid development projects extend existing MV feeders to serve unelectrified housing clusters, but MV feeders have limited extension lengths when power quality is taken into account. Ultimately, the length of a medium voltage feeder or lateral line is a function of conductor size and load; larger conductors can support higher levels of demand. To simplify the modelling process, the extension of 11kV feeders has been limited to 40 kilometres from the source to the termination point, while the extension of 33 kV feeders has been limited to 85 kilometres from the source to the termination point.

If the transmission network, including grid substations, were extended to all areas of Zambia, the MV grid network could theoretically be extended to serve all communities and housing clusters. However, transmission networks are extended only when electricity demand is sufficiently high to justify investment in transmission development. When evaluating MV network development, the same principle applies. Grid development should be considered only when the net present value of the investment's future economic benefits exceeds the expected investment cost. For grid development, investment costs should generally be limited to no more than US$1,300 to US$1,500 per connected consumer. For purposes of the analysis, grid development costs have been limited to US$1,300 per connection.

4.7. Mini-grid and Standalone Solar Analysis

Off-grid electrification development will play a significant role in implementing the REMP, given the low population density in some remote areas of Zambia and the high cost of grid development to serve them. Off-grid technologies use distributed generation technology to provide reliable service to rural communities at costs that can be lower than grid extension when the communities are distant from existing grid infrastructure and loads do not justify the extension of grid service.

The geospatial model began by clustering housing structures into groups that could be served by either distribution transformers or mini-grids. For additional remote housing clusters, clusters were evaluated using a 1,000-meter radius and a minimum size of 100 housing structures; those that did not meet these requirements were excluded from consideration as mini-grids.

In some cases where multiple clusters are located very close to one another, groups of clusters were evaluated as medium voltage mini-grids. In most cases, however, mini-grids were evaluated as individual low-voltage mini-grids, each served by an independent generation and battery storage system, with a low-voltage network designed to distribute power to all housing structures within the mini-grid service area.

As the mini-grids were defined and evaluated, a routing algorithm was applied to determine the most cost-effective low-voltage feeder alignments required to interconnect all consumers within each mini-grid service area. A parametric model was then used to evaluate the generation and storage requirements of each mini-grid, providing a first-order approximation of mini-grid system costs.

In the subsequent stage of the modelling process, mini-grids are categorised by the number of consumers they serve. A series of HOMER Energy optimisation analyses was conducted to refine the design of the mini-grid generation, storage, and control systems, as well as other operational characteristics. These analyses are also used to estimate key performance indicators such as the levelized cost of energy (LCOE) and the renewable energy fraction for each mini-grid category.

Final mini-grid cost estimates are derived following the HOMER Energy optimisation analysis, drawing on the unit cost assumptions presented in Section 4.4.

Housing clusters that do not meet the criteria for grid extension or mini-grid development are considered suitable for electrification through standalone solar systems.

4.8. REMP Geospatial Database and Visualisation Platform

As part of the REMP update process, a GIS database was developed to integrate the datasets used in the electrification analysis and store the results generated by the geospatial modelling. The database consolidates spatial information on housing structures, electricity infrastructure, road networks, administrative boundaries, and other datasets used in the electrification planning process.

The analytical outputs of the modelling process, including Electrification Areas and proposed electrification options, are stored within this geospatial database. The database, therefore, serves as the central repository for information generated by the updated REMP.

To facilitate access to this information, a Visualisation Platform has been developed, enabling stakeholders to view the results of the electrification analysis in an interactive spatial format. The platform allows users to explore Electrification Areas, proposed electrification options, and other relevant datasets to support planning, coordination, and investment decision-making in the rural electrification sector.

To ensure broader accessibility, the key outputs of the geospatial analysis are also presented in the Annexes of this plan, which provide a detailed listing of Electrification Areas and proposed electrification options across the country.

4.9. Productive Uses of Electricity

Promoting the productive use of electricity (PUE) is an important consideration in rural electrification planning, as it enables access to electricity to contribute directly to economic development, job creation, and improved livelihoods in rural communities. Electrification programmes that support productive activities help stimulate electricity demand, improve the utilisation of electricity infrastructure, and maximise the socio-economic benefits of electrification investments.

In rural areas, electricity can significantly enhance existing economic activities by improving efficiency, reducing operating costs, and enabling new forms of enterprise. Access to reliable electricity can support agricultural production and value addition, including agro-processing, irrigation, food preservation, and cold storage. It can also facilitate the development of micro and small enterprises such as grain milling, welding, carpentry workshops, tailoring, and other service-based businesses that contribute to local economic development.

Despite these opportunities, the economic potential of electrification may not always be fully realised without complementary support. In many cases, rural communities and entrepreneurs may have limited awareness of the opportunities associated with electricity access, or they may face constraints such as limited access to finance, technical skills, or appropriate electric equipment required to utilise electricity productively.

To address these challenges, electrification initiatives under the REMP will be complemented by measures aimed at promoting productive uses of electricity in communities targeted for electrification. These measures may include awareness programmes to demonstrate the benefits of electricity for income-generating activities, business development training for local entrepreneurs, and technical guidance on adopting appropriate electric technologies and equipment. Facilitating access to financing will also be essential to enable rural enterprises and farmers to invest in electric-powered machinery and equipment that can enhance productivity and expand economic opportunities.

REA will collaborate with GRZ institutions, cooperating partners, financial institutions, and the private sector to support the development of productive uses of electricity in Electrification Areas identified under the REMP. By linking electrification investments with initiatives that promote agricultural value chains, rural enterprises, and local economic activities, the REMP seeks to ensure that electricity access contributes meaningfully to rural economic transformation.

In addition, productive uses of electricity can improve the utilisation and financial sustainability of electrification infrastructure. Productive activities such as agro-processing, irrigation, cold storage, and rural enterprises can increase daytime electricity consumption and contribute to a more balanced electricity demand profile. This is particularly important for decentralised electrification systems such as mini-grids, where higher and more stable demand improves the economic viability of investments. Promoting productive use applications will therefore form an important complementary component of electrification initiatives implemented under the REMP.

4.10. Clean and Efficient Cooking Solutions

To make clean cooking available to everyone by 2030 under the SDGs agreed by UN member states, immense progress has been made in improving access to clean cooking facilities, but to date, momentum has been slower in Africa. In tracking SGD 7 of ensuring access to affordable, reliable, sustainable, and modern energy for all, current global statistics according to the Energy Progress Report of 2024, stood at 74% of the global population having access to clean fuels and technologies for cooking. Sub-Saharan Africa, however, still lags with only 22% of its population having access to safe, portable, and efficient cooking systems.

The International Energy Agency (IEA) highlights that inadequate access to clean cooking methods has detrimental effects across multiple sectors, including but not limited to negatively impacting public health, hindering economic progress, undermining educational opportunities, and damaging the environment, including its habitats. Further, the reliance on traditional biomass for cooking, which affects around 1 billion people in sub-Saharan Africa, results in 815,000 premature deaths annually on the continent. Across the continent, women and girls spend on average four hours a day gathering fuel and cooking, often foregoing education or remunerated activities as a result.

The lack of clean cooking is also linked to the loss of 1.3 million hectares of forest each year, diminishing a key resource for the continent. The combined impact of this and the direct emissions from a lack of access to clean cooking is equivalent to a quarter of Africa's energy-related CO_2 emissions today[12].

To drive the clean cooking agenda and ensure that sub-Saharan African countries contribute to universal access by 2030, policy and financing efforts must be strengthened. These include strengthening clean cooking policy frameworks and Investments in clean cooking infrastructure and appliances.

Under the Energy Compact for Zambia, GRZ has committed to increasing access to clean cooking solutions from approximately 9% of the population to at least 40% by 2030, through the accelerated deployment of clean and efficient cooking technologies. Achieving this target will require coordinated efforts across policy, financing, and implementation, including scaling up investments, strengthening institutional frameworks, and promoting the adoption of appropriate clean cooking solutions[13].

Furthermore, the REMP incorporates the promotion of clean and efficient cooking technologies as a complementary initiative to electrification efforts, especially for communities electrified through solar mini-

[12] Unlocking Clean Cooking Pathways, Energy Sector Management Assistance Program
[13] A Vision for Clean Cooking Access for All Report, International Energy Agency

grids and solar home systems. The REMP prioritises the deployment of diverse clean cooking and efficient appliances for rural households across the country, tailored to local contexts. In addition, a variety of clean and efficient cooking solutions will be provided for public institutions.

4.10.1. Household Cooking Solutions

Integration of clean cooking with rural energy programs will enhance the overall efficiency and sustainability of energy use, reduce greenhouse gas emissions, and improve household health and well-being. Key interventions will include:

i. Biogas Digestors targeted for rural households with livestock
ii. Ethanol stoves, depending on enabling conditions
iii. Improved Firewood Stoves to mitigate the inefficient utilisation of firewood
iv. Improved Charcoal Stoves to mitigate the inefficient utilisation of charcoal
v. Pellet Gasifier Stoves
vi. Electric Pressure Cookers

4.10.2. Public Facility Cooking Solutions

Integration of clean, efficient cooking solutions will mitigate overreliance on firewood as a cooking energy source. Key interventions will include:

i. Biogas Digestors targeted public facilities with livestock for a sustainable supply of feedstock.
ii. Institutional Electric Pressure Cookers, depending on enabling conditions.

4.10.3. Barriers and Enabling Mechanisms

The deployment and adoption of clean and efficient cooking solutions have faced barriers, including the high upfront cost of appliances and cultural preferences for utilising traditional cooking methods.

To address this challenge, the following mechanisms have been recommended:

i. Subsidy programs: Implement subsidy programs that will enable low-income households to have access to clean and efficient appliances.
ii. Training and awareness programs: conduct stakeholder training and awareness on the benefits and utilisation of clean and efficient cooking appliances.

The Government will work with development partners, private-sector actors, and local communities to expand access to affordable clean cooking technologies through targeted subsidies, awareness campaigns, and innovative financing mechanisms. By aligning clean cooking initiatives with rural electrification, the REMP ensures a holistic approach to energy access that meets both household and productive energy needs, contributing to national development objectives and the achievement of SDG 7, ensuring access to affordable, reliable, sustainable, and modern energy for all.

4.11 Limitations of the Analysis and Key Assumptions

The electrification analysis presented in this chapter is based on the best available data and modelling assumptions at the time of the REMP update. However, the analysis is subject to several limitations, including uncertainties in population growth projections, changes in technology costs, variations in electricity demand patterns, and potential changes in infrastructure development.

The results of the analysis should therefore be interpreted as indicative planning outputs intended to guide investment decisions rather than detailed engineering designs for individual electrification projects.

CHAPTER 5. RESULTS AND FINDINGS

5.1. Grid Development Results

5.1.1. Provincial Grid Development Results

The geospatial electrification modelling framework was used to identify areas where grid development represents the most cost-effective electrification option. The modelling process involved aggregating housing structures into clusters using a clustering algorithm, estimating electricity demand for each cluster, and determining the required distribution transformer capacities. The transformers were then interconnected along existing road networks within the geospatial modelling environment to define potential grid development Electrification Areas.

Once grid development Electrification Areas were identified, the unit cost parameters presented in Table 6 were applied to estimate the cost of MV lines, distribution transformers, LV distribution networks, and service connections for each Electrification Area. The results of the grid development modelling are illustrated in Figure 13, which presents the potential grid development Electrification Areas identified within the geospatial modelling platform using a maximum connection cost threshold of US$1,300 per connection.

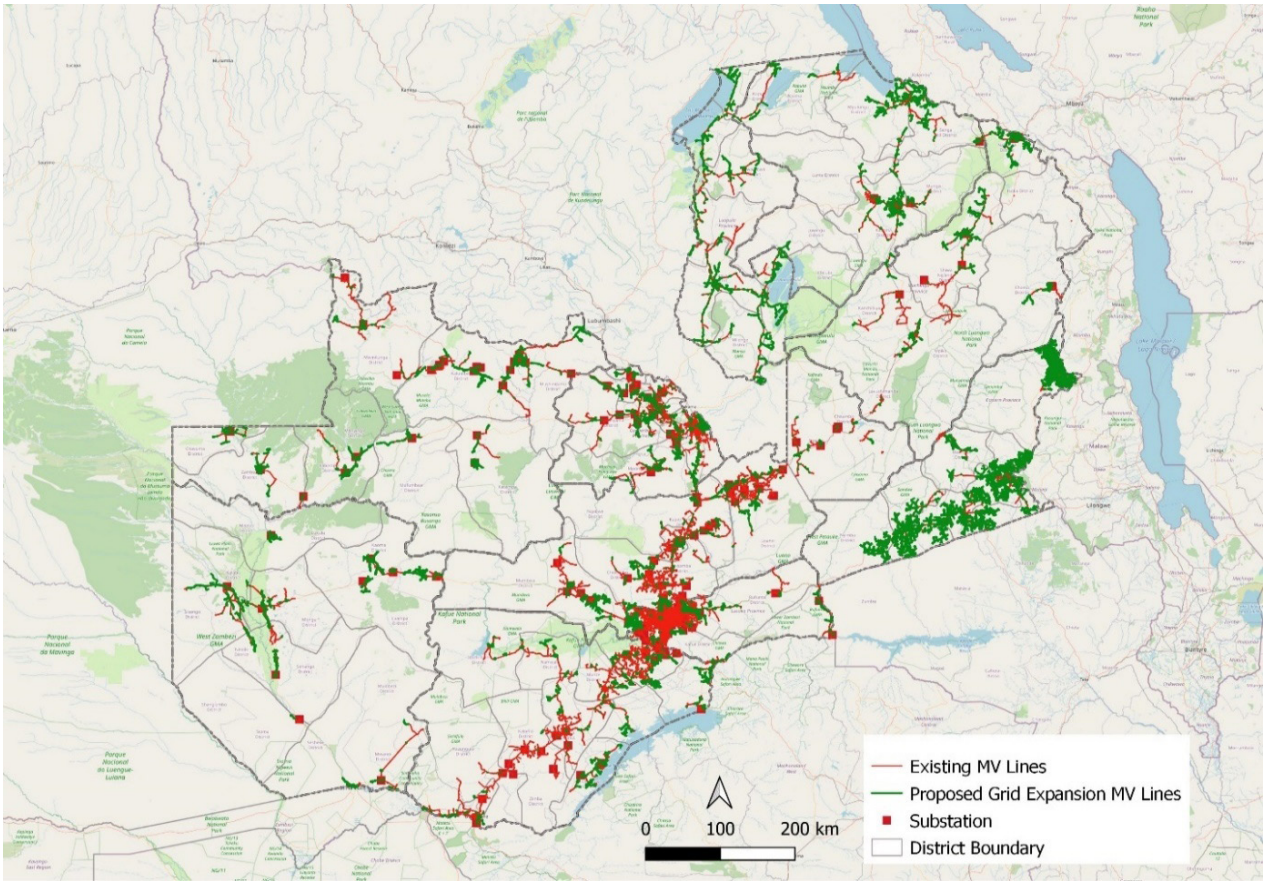

Figure 13: Grid development REMP results

Table 9 summarises the grid development results at the provincial level. Detailed information on Electrification Areas and the associated technical parameters for grid development is provided in Annexes 1 and 2, respectively.

Table 9: Grid development project results summarized by province

Province	No. of Electrification Areas	Projected Connections	Demand (kW)	No. of Transformers	MV Length (m)	LV Length (m)	Cost (US$)
Central	372	56,212	11,136	1,051	1,120,748	3,750,660	62,385,570
Copperbelt	352	65,998	12,645	929	911,566	2,977,678	52,638,838
Eastern	530	218,793	41,929	3,085	4,295,465	8,025,445	181,841,230
Luapula	389	67,925	13,110	1,032	1,059,009	2,660,687	54,093,257
Lusaka	147	25,627	5,041	451	429,742	1,517,890	25,070,819
Muchinga	303	67,357	12,663	749	724,609	2,224,781	43,442,183
Northern	245	52,443	10,253	888	1,144,396	2,504,050	50,822,674
North Western	568	93,608	17,885	1,272	1,013,343	3,559,601	65,415,216
Southern	325	48,987	9,654	878	934,457	2,794,442	48,753,959
Western	208	42,610	8,328	722	883,693	1,815,528	37,354,556
Grand Total	**3,439**	**739,560**	**142,644**	**11,057**	**12,517,028**	**31,830,762**	**621,818,302**

The modelling results in Table 10 indicate that grid development could connect approximately 739,560 additional consumers at an estimated total cost of US$622 million, with an average connection cost of approximately US$841 per consumer. If implemented, these projects would add approximately 143 MW of peak demand to the national electricity system, requiring additional generation capacity connected to the national grid.

To assess the sensitivity of the results to changes in connection cost thresholds, an additional analysis was performed using a higher maximum grid connection cost of US$1,500 per connection. Under this scenario, the number of grid development connections increases from approximately 740,000 to 826,000 connections, while the total estimated investment increases from US$622 million to US$752 million. The average cost per connection increases from US$841 to US$911 under this higher cost threshold.

5.1.2. ZESCO and Private Sector Grid Development Opportunities

The REMP grid development analysis distinguishes between areas most likely to be served by ZESCO and those that may offer opportunities for private-sector participation.

Private sector opportunities were identified in areas where electrification projects can be supplied from one or two tapping points from the existing ZESCO 33 kV network and where at least 2,500 consumers can be served within a contiguous geographic area. Areas that do not meet these criteria are assumed to be better served by conventional grid development implemented by ZESCO.

Table 10 summarises the modelling results for grid development Electrification Areas by potential service provider.

Table 10: ZESCO and private sector modelling results for grid development

Service Provider	Projected Connections	No. Electrification Areas	Estimated Cost (US$)	Cost per Consumer (US$)
ZESCO	636,341	3,260	524,207,143	824
Private sector	103,219	179	97,611,159	946
Totals	**739,560**	**3,439**	**621,818,302**	**841**

The results indicate that most grid development Electrification Areas are expected to be implemented by ZESCO, accounting for approximately 636,341 connections, while about 103,219 connections may present opportunities for private sector participation.

5.2. Mini-grid Development Results

Following completion of the grid development analysis, the remaining unelectrified housing clusters were evaluated for suitability for off-grid electrification solutions. This evaluation focused on areas where grid development costs exceeded the maximum connection cost threshold or where settlements were too dispersed to be economically served by the MV distribution network.

The analysis was conducted in two stages. First, housing clusters with relatively higher population densities were evaluated for potential mini-grid development. According to the modelling criteria used in the geospatial analysis, mini-grid projects must serve at least 100 housing structures within approximately 1,000 metres of the cluster centre.

The modelling results indicate that the number of viable mini-grid sites is relatively limited, as many settlements can already be economically served through grid development. Consequently, only a small number of villages and housing clusters remain that are not easily connected to the main grid.

Figure 14 illustrates the mini-grid locations identified in the geospatial modelling exercise.

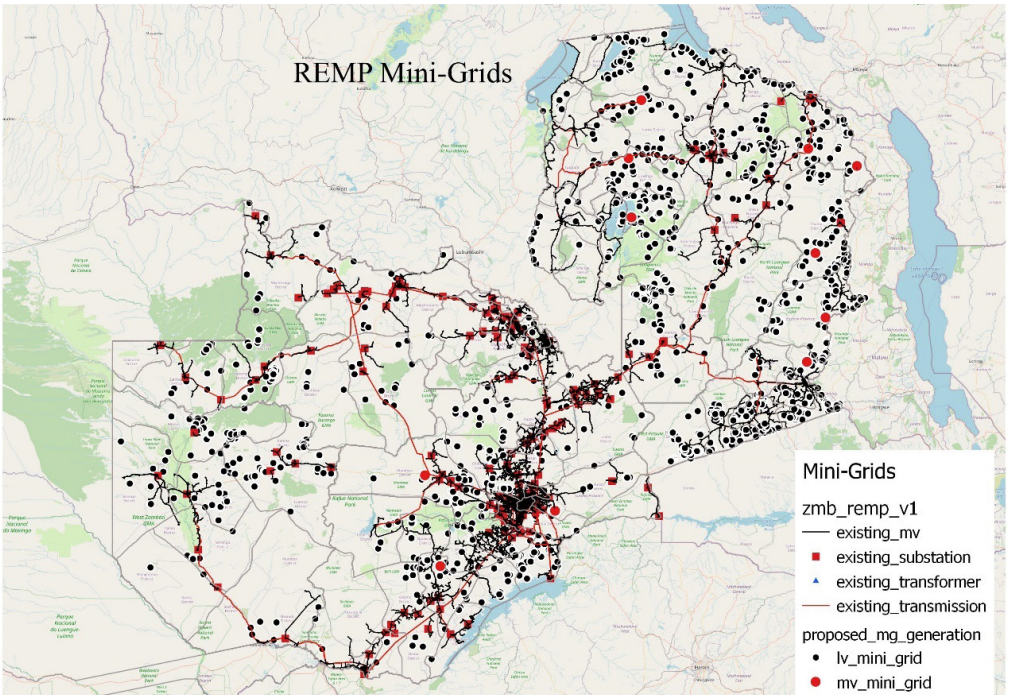

Figure 14: Mini-grids results.

Tables 11 and 12 present the results of MV and LV mini-grid development in Electrification Areas by province, respectively. Detailed technical parameters and Electrification Area information for MV and LV mini-grids are provided in Annexes 3, 4, 5, and 6.

The modelling results identified:

i. 11 MV mini-grids, capable of serving approximately 88,679 consumers, and
ii. 1,421 LV mini-grids, capable of serving approximately 239,625 consumers.

The estimated cost of developing MV mini-grids is approximately US$162 million, while LV mini-grids are estimated to cost approximately US$447 million. These costs include both the distribution network infrastructure and the associated generation facilities required to operate the mini-grids independently of the national grid.

The generation systems for the mini-grids were designed to provide Tier 3 electricity access in accordance with the MTF, sized to deliver 24-hour electricity service.

Table 11:MV mini-grid development projects.

Province	No. of Electrification Areas	Projected Connections	Demand (kW)	MV Length (m)	LV Length (m)	Solar PV (kWp)	Total Cost (US$)
Central	1	4,235	856	170,362	342,226	2,141	8,630,688
Eastern	2	15,256	3,034	498,666	855,426	7,585	29,426,714
Lusaka	1	6,571	1,306	177,112	445,355	3,266	12,242,637

Table 12: Low voltage mini-grid projects by province

Province	No. of Electrification Areas	Projected Connections	Demand (kW)	LV Length (m)	Solar PV (kWp)	Total Cost (US$)
Central	150	22,389	4,060	1,320,213	10,153	45,967,120
Copperbelt	23	3,639	658	220,283	1,645	7,492,321
Eastern	355	63,947	11,495	2,129,848	28,747	114,172,383
Luapula	69	14,833	2,648	432,411	6,623	25,608,338
Lusaka	16	2,786	502	144,843	1,254	5,476,206
Muchinga	224	36,775	6,638	1,673,382	16,600	70,324,452
Northern	252	42,759	7,706	1,593,034	19,272	78,257,374
North-Western	97	16,817	3,028	631,721	7,573	30,781,085
Southern	118	18,036	3,267	1,028,799	8,171	36,635,970
Western	117	17,644	3,199	694,260	7,999	32,933,270
Grand Total	**1,421**	**239,625**	**43,201**	**9,868,794**	**108,037**	**447,648,519**

A sensitivity analysis was also performed using a higher grid development cost threshold of US$1,500 per connection. Under this scenario:

i. the number of LV mini-grids decreases slightly from 1,421 to 1,371, and
ii. the number of MV mini-grids decreases from 11 to 9.

Correspondingly, the total cost of mini-grid investments decreases slightly due to the increased number of settlements that can be economically connected through grid development.

Mini-grid Electrification Areas were also evaluated to identify potential opportunities for private-sector developers and rural electric cooperatives. Cooperative mini-grids were defined as those that do not overlap with existing private sector mini-grid initiatives, including projects under the Increased Access to Electricity and Renewable Energy Production (IAEREP), Beyond the Grid Fund for Zambia (BGFZ), and Electricity Service Access Project (ESAP) programmes, and those that can serve a minimum of 1,500 consumers in aggregate.

Table 13 summarizes the private sector and cooperative modelling results for mini-grids.

Table 13: Private and Cooperative mini-grid results

Service Provider	Projected Connections	No. Electrification Areas	Estimated Cost (US$)	Cost per Consumer (US$)
Private Companies	157,806	966	299,284,820	1,931
Rural electric cooperatives	81,819	455	148,363,699	1,839
Totals	**239,625**	**1,421**	**447,648,519**	**1,885**

The results suggest that both private developers and rural electric cooperatives could play an important role in implementing mini-grid electrification projects across rural Zambia.

5.3. Standalone Solar Solution Results

Standalone solar solutions – also referred to as solar home systems, are used to provide light, mobile phone charging and appliance loads in areas where grid and mini-grid service are not financially or economically viable. Standalone solar solutions use solar photovoltaic panels, controlled by electronic controllers and connected to batteries, to provide low-cost electricity service to individual households, small businesses, and, in some cases, public facilities. These systems can be dimensioned to meet large demands where needed, but for purposes of general residential electrification needs, most often are dimensioned to provide 2-4 hours of nighttime service. For purposes of the REMP, standalone solar systems will be dimensioned to provide Tier 1 service.

Evaluation of standalone solar solutions is performed by numerically analysing cases where grid development and mini-grid services cannot provide electrification to the remaining unelectrified households. That is, households not included in the grid and mini-grid solution sets are designated for standalone solar service, to be provided by solar home systems.

After considering grid development and consumers likely to be served by MV and LV mini-grids, the remaining unelectrified housing structures number approximately 1,440,000. That is, grid development will serve approximately 740,000 housing structures at a maximum connection cost of US$1,300, while MV and LV mini-grids will serve up to 328,000 new connections. If the ceiling for grid-connected projects is raised from US$1,300 to US$1,500, grid development connections will increase to 826,000 and mini-grid connections will decrease to 312,000 connections. At this higher level of grid development cost, standalone solar connections would decrease from 1,440,000 to 1,370,000. Table 14 illustrates standalone solar system results by province as evaluated in the geospatial electrification analysis. Detailed information on solar home systems is provided in Annex 7.

Table 14: Standalone solar results illustrated by province.

Province	Projected Connections	Cost (US$)
Central	326,813	65,362,600
Copperbelt	111,036	22,207,200
Eastern	171,084	34,216,800
Luapula	59,276	11,855,200
Lusaka	42,911	8,582,200
Muchinga	105,570	21,114,000
Northern	148,281	29,656,200
North-western	68,083	13,616,600
Southern	254,404	50,880,800
Western	152,549	30,509,800
Total	**1,440,007**	**288,001,400**

5.4. Summary of Electrification Development Costs by Technology

The REMP geospatial electrification analysis was performed using two maximum connection costs for grid development modelling: US$1,300 and US$1,500. Table 15 presents a summary of the estimated number of connections and investment levels required for grid development, MV mini-grids, LV mini-grids, and standalone solar solutions. The analysis indicates that the total estimated cost of the REMP expansion is US$1.52 billion if the maximum grid extension cost is US$1,300, and US$1.60 billion if it is US$1,500 per connection.

Table 15: REMP electrification expansion estimates

Electrification Technology	Connection with grid cost < US$1,300	Estimated Cost (US$)	Connection with grid cost < US$1,500	Estimated Cost (US$)
Grid Development	739,560	621,818,302	826,118	752,604,373
MV Mini-Grid	88,679	162,492,189	80,613	146,233,337
LV Mini-Grid	239,625	447,648,519	231,255	431,887,737
SHS	1,440,007	288,001,400	1,369,885	273,977,000
Total	**2,507,871**	**1,519,960,410**	**2,507,871**	**1,604,702,447**

CHAPTER 6. BUSINESS MODELS

6.1. Introduction

The REMP serves as a planning and budgeting framework that REA will utilise to allocate GRZ investments towards grid development and off-grid electrification projects. Once electrification investments are made, the financed infrastructure will transition from construction to operation and must be managed by a service provider capable of ensuring electricity services to residential, commercial, small industrial, and public facility consumers on a modern, reliable, sustainable, and affordable basis in accordance with SDG7.

Given that the REMP has identified and evaluated three (3) primary technology options to expand electrification service to rural areas in Zambia, the business models will vary by technology. Table 16 below illustrates the business models that will likely be used for grid development, mini-grids, and standalone solar electrification service.

Table 16: Service Provider Options

Technology	Business Model Approach
Grid development	ZESCO, Private Sector
Mini-grids	GRZ led Models, Private led Developer Model, Private Led electric cooperatives Model
Standalone solar service	GRZ Models, Private led Solar Service Providers (SSP) Model

6.2. Grid Development

The primary modality of rural electrification expansion has been for REA to manage planning, project selection, financing, and project management for all grid development projects. Upon project completion, the medium and low voltage networks have been handed over to ZESCO, which has taken on the responsibility for consumer connections, operation, and maintenance of the newly constructed distribution infrastructure. The focus of the 2008 REMP was on REA financing grid development projects, particularly to connect public facilities such as rural health centres, schools, and government administrative offices. Meanwhile, ZESCO was expected to handle connections for residential, commercial, and small industrial consumers.

This practice has changed in recent years. REA is now focused on financing all facets of grid development, including service connections. The REMP grid development analysis has been divided into two (2) categories of service expansion: areas that will likely be served by ZESCO and areas that will likely be served by the private sector. Private Sector opportunities are identified as areas that can derive service from one or at most two tapping points on the ZESCO 33 kV network and can serve a minimum of 2,500 consumers within a contiguous geographic area. ZESCO grid development therefore applies to all other areas that do not meet this criterion.

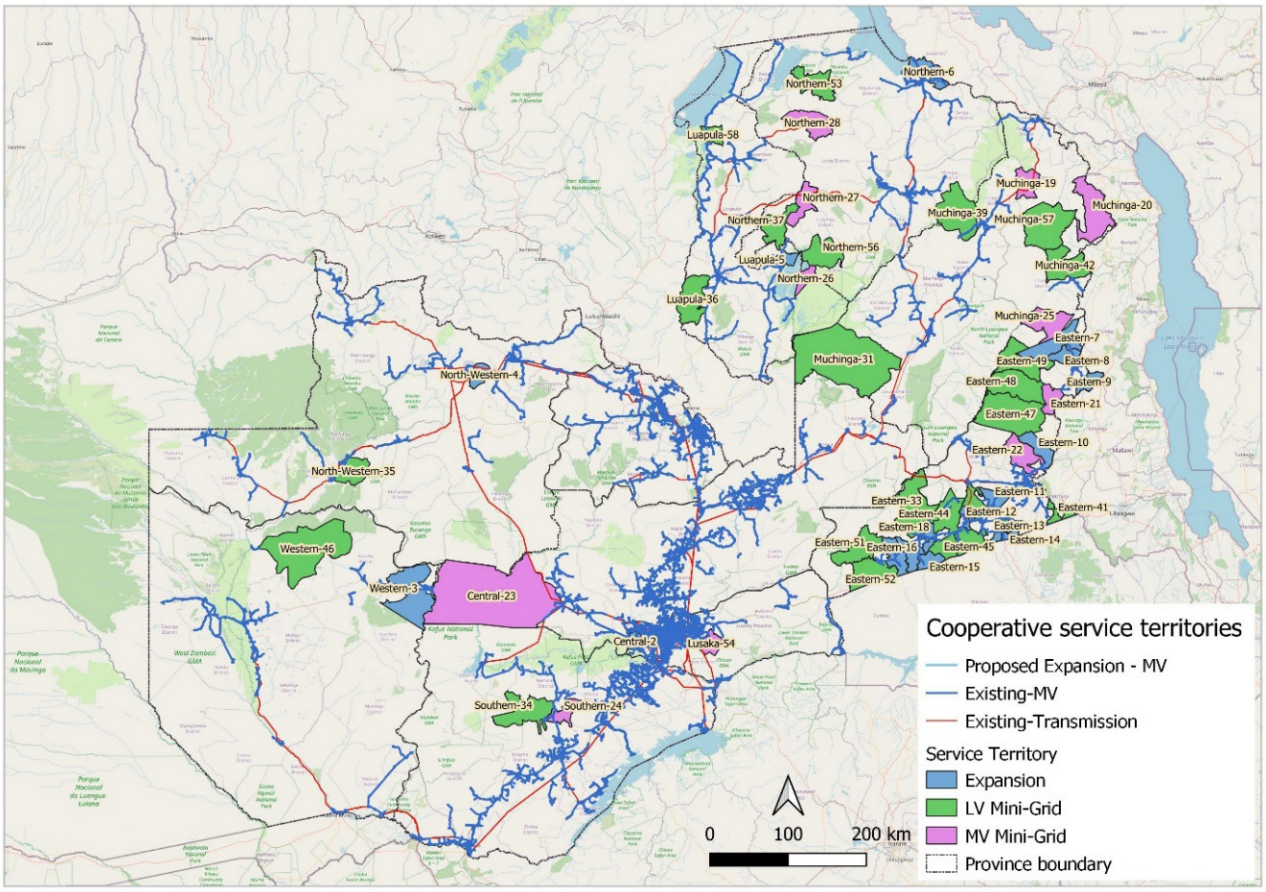

Figure 15: Private Sector/Cooperative service territories for grid development and mini-grid electrification.

6.3. Mini-Grid Development

Mini-grid development in Zambia has gained significant momentum over the past 5 years, driven by both REA and private-sector developers. At the time of the REMP analysis in 2024, approximately 53 mini-grids were operational across the country, with 13 implemented by REA and about 40 developed by private sector operators.

The financing model for mini-grids includes funding from Government as well as funding from cooperating partners, including the European Union (EU), the World Bank,[14] and private mini-grid investors relying on a co-financing model with sponsor equity contributions from the mini-grid developers and matching grants from the aforementioned donors.

Mini-grid developers engage in a competitive bidding process for Donor funding and once approved, the developers must raise equity and/or loan capital to implement qualifying mini-grid projects. This funding arrangement is expected to accelerate in the coming years as additional capital is raised and experience is gained in mini-grid implementation. The REMP mini-grid modelling identified 1,421 mini-grids for development.

[12] Beyond the Grid Fund is financed by the governments of Sweden, Denmark, Norway and Germany.

The models considered under mini-grids are as follows:

i. GRZ led Models;
ii. Private Led Mini-grid Developer Model; and
iii. Private Led Cooperative Model.

6.3.1 GRZ led Models

6.3.1.1 Government Induced Community-Based Business Models (Cooperatives Model)

Under this model, the Authority fully or partially finances the development and construction of solar mini-grids (SMGs), while operations and maintenance are undertaken by a community-based entity, such as a cooperative or other organised community structure.

Where SMGs are linked to productive-use initiatives, such as Solar Milling Plants (SMPs), existing cooperatives managing those facilities are prioritised as operators of the mini-grids. In areas without SMP-linked cooperatives, other community structures may be identified, subject to meeting minimum governance and organisational requirements.

Successful implementation of this model requires the Authority to provide targeted technical, business, and governance support to ensure effective system operation, sustainability, and financial management.

6.3.1.2 Operations and Maintenance Model

Under the O&M Model, REA retains responsibility for the design, financing, and construction of SMGs. A private operator is then competitively procured, in accordance with Zambia Public Procurement Authority (ZPPA) procedures, to manage operations and maintenance under a performance-based contract.

The operator is responsible for day-to-day system operation, routine and corrective maintenance, and component replacement as required. Consumers pay tariffs based on approved service levels, while the operator deploys qualified personnel to ensure reliable and efficient system performance.

6.3.1.3 Interim REA Model

Under the Interim REA Model, the Authority assumes direct responsibility for the O&M of SMGs on a temporary basis. This approach is applied in exceptional circumstances where neither the Cooperative Model nor the O&M Model is immediately viable.

This model is typically used for systems characterised by small size, limited customer bases, remote locations, or insufficient demand to attract private operators or sustain community-based management. During this interim period, REA deploys internal technical and operational resources to maintain service continuity while longer-term solutions are developed.

6.3.1.4 Public Private Partnership (PPP) Model

Under the Public Private Partnership (PPP) model, REA may either undertake feasibility studies for identified rural electrification projects or collaborate with private sector entities to develop project proposals for submission to the PPP Department.

Upon submission, the PPP Department reviews the project proposal and, where appropriate, forwards it to the PPP Technical Committee for detailed evaluation. If the proposal is found to be viable, the Technical Committee submits its recommendation to the PPP Council for consideration. The Council, upon receipt of the recommendation, may approve or reject the project, or approve the award of a PPP agreement.

Following approval, the procurement and implementation of the project are undertaken in accordance with the provisions of the Public Private Partnership Act and the Public Procurement Act. The PPP Department plays a central role in facilitating the structuring and execution of PPP agreements, while REA will maintain close coordination with the Department throughout the project cycle to ensure effective engagement with the private sector and successful delivery of the project.

6.3.1.5 Market Model

Market-based models are applied where rural electrification projects demonstrate potential for commercial viability. Under this approach, private sector developers finance, develop, and operate mini-grid systems with the objective of achieving a positive rate of return.

To enhance project attractiveness and affordability, REA may provide targeted incentives, including capital subsidies and technical assistance. These interventions help reduce investment risk and improve access to electricity for underserved communities.

6.3.2 Private Led Developer Models

Under this model, private developers independently invest in, own, and operate off-grid power systems. The developer is responsible for financing, construction, operation, maintenance, and eventual replacement of system components.

Consumers pay for electricity either through metered consumption (kWh-based tariffs) or fixed monthly charges. Tariffs are typically set at levels that ensure financial sustainability while reflecting local market conditions.

6.3.3 Private Led Electric Cooperative Model

The private-led electric cooperative model is applicable in areas where grid electrification is not prioritised under the REMP. Its success depends on strong community participation, including majority approval to establish and operate cooperative-owned mini-grids.

This model is most viable in communities with sufficient population density and economic activity. While small low-voltage mini-grids may be considered, economic sustainability is more likely when systems are scaled, either through clustering multiple low-voltage mini-grids or developing medium-voltage mini-grids reaching at least 1,500 consumers.

6.4. Standalone Solar Service Providers

Standalone solar systems have become an increasingly important electrification solution in Zambia, supported by a growing number of private service providers. It is estimated that over 295,000 rural households have either purchased solar PV systems or entered into service agreements with solar providers.

A significantly larger number of households use solar lanterns and basic solar products; however, these do not meet the minimum electrification threshold defined under the National Electrification Strategy (Tier 1 of the Multi-Tier Framework).

While some consumers acquire systems through direct purchase, the dominant delivery model is through private companies offering pay-as-you-go (PAYGO) solar home systems. This model has proven scalable across East Africa including Kenya, Tanzania, and Uganda and is well-suited to leveraging public financing through Results-Based Financing (RBF) mechanisms.

The models considered under standalone solar systems are as follows:

6.4.1 GRZ Led Model

6.4.1.1 Results Based Financing

The Government will adopt an RBF model to support the deployment of standalone solar systems. This approach has already been piloted by the MoE with support from the World Bank and is expected to be expanded under the REMP.

A key design consideration for RBF is determining the appropriate level of incentives required to stimulate market expansion in rural areas, where lower population density and income levels present additional challenges for private providers.

6.4.2.2 Private Led SSP Model

This represents the business-as-usual model for standalone solar service providers in rural Zambia. Private companies supply solar home systems directly to consumers, typically using PAYGO or retail sales models. To enhance competitiveness and expand market reach, providers may access grant financing or other forms of support from development partners. Such support helps reduce end-user costs and enables deeper penetration into underserved rural markets.

CHAPTER 7. REMP FINANCING AND IMPLEMENTATION PLAN

7.1. Introduction

Following the completion of the electrification analysis, the results have been translated into an actionable implementation plan to guide the systematic expansion of electricity access across rural Zambia. The REMP therefore provides a framework for sequencing electrification investments across the country, while ensuring that the required financial resources and institutional capacity are aligned with the objective of achieving universal electricity access.

The electrification analysis undertaken under the REMP identifies suitable electrification options for rural communities based on a LCGEP approach. These results provide the basis for planning the implementation of Electrification Areas using different technologies, including grid development, mini-grids, and standalone solar systems.

The implementation plan presented in this chapter outlines the projected rollout of electrification investments, the expected number of connections to be achieved, and the corresponding financing requirements over the implementation period.

7.2. Organisation of Electrification Investments

The electrification analysis undertaken under the REMP identifies the most suitable electrification options for rural communities across Zambia. To facilitate planning and coordination, rural settlements have been organised into Electrification Areas, grouping communities by geographic proximity, population distribution, and infrastructure characteristics.

Each Electrification Area has been evaluated within the geospatial electrification model to determine the most cost-effective technology option for providing electricity access.

These options include:

i. Grid development from the national electricity network;
ii. mini-grids; and
iii. Standalone solar systems such as solar home systems.

The results of the geospatial analysis provide a clear understanding of the number of structures to be served, the estimated costs of electrification, and the most appropriate technology solution for each Electrification Area.

For implementation purposes, electrification investments will be sequenced over time based on several factors, including expected development impact, cost considerations, implementation capacity, and financing availability.

7.3. Phasing and Distribution of Electrification Projects

Achieving universal access to electricity requires a large-scale expansion of electrification infrastructure across the country. However, the pace at which electrification projects can be implemented will depend on the availability of financing, the capacity of implementing institutions, and the ability of contractors and developers to mobilise resources.

The distribution of electrification projects over the implementation period has been structured to reflect practical considerations related to implementation capacity, financing availability, and the complexity of different electrification technologies.

In the initial years of implementation, a lower number of projects is prioritised to allow for the gradual scaling up of institutional, technical, and contractor capacity. This phased approach ensures that systems, processes, and supply chains are adequately established before full-scale implementation is undertaken.

As implementation progresses, the number of projects increases to reflect improved readiness, enhanced coordination mechanisms, and the mobilisation of financing. The peak implementation period occurs in the middle years of the plan, where capacity, funding, and stakeholder alignment are expected to be fully developed.

In the later years, the number of projects gradually stabilises as the programme shifts focus towards completing remaining areas, addressing more complex or remote locations, and consolidating gains towards achieving universal access.

The distribution of projects also varies by technology due to differences in implementation characteristics:

i. Grid Development projects are scaled up progressively, reflecting the need for detailed design, procurement processes, and significant capital investment. Early years focus on preparation and mobilisation, while later years reflect full-scale implementation.
ii. Mini-grid projects, particularly medium-voltage mini-grids, are implemented later in the programme due to their higher complexity, need for detailed feasibility studies, and reliance on private sector participation and financing. The limited number of such projects also reflects their targeted application in specific high-demand areas.
iii. Low-voltage mini-grids are deployed more steadily across the implementation period, as they are less complex than MV mini-grids but still require coordination with developers and financing arrangements.
iv. Standalone solar systems are deployed consistently across all years due to their modular nature, relatively lower complexity, and suitability for rapid deployment. This technology allows for immediate expansion of access, particularly in remote and dispersed areas.

Overall, this phased distribution ensures a balanced approach that aligns implementation capacity with investment requirements, while enabling the gradual scaling up of electrification efforts towards achieving universal access by 2030.

The implementation of electrification projects, subject to availability of funds, shall be predominantly informed by;

i. 80% of the projects shall be drawn from the REMP implementation schedule,
ii. 20% of the projects shall be allocated to demand-driven or requested sites.

Table 17 presents the projected number of Electrification Areas or installations by technology for each implementation year.

Table 17: Electrification Area implementation projections by technology and year.

Technology	Structures	Electrification Areas	2025	2026	2027	2028	2029	2030
Grid Development	739,560	3,439	96	522	798	680	708	635
MV mini-grids	88,679	11	-	-	-	1	-	10
LV mini-grids	239,625	1,421	61	194	220	342	324	280
Standalone solar	1,440,007	N/A	240,001	240,001	240,001	240,001	240,001	240,002

7.4. Connection Projections

Because all Electrification Areas have been evaluated individually within the geospatial electrification model, their expected impacts in terms of connected consumers can be readily estimated once selected for implementation.

Table 18 presents a summary of the projected number of connections that will be achieved by investment year, corresponding to the Electrification Areas included in Table 17.

Grid development connections are expected to increase based on the number and location of Electrification Areas implemented each year. In contrast, projections for low-voltage mini-grids and standalone solar systems remain relatively stable across the implementation period.

Given that mini-grids and standalone solar systems are expected to be implemented primarily by private-sector developers, the implementation schedule for these technologies may need to be adjusted based on the availability of financing and developers' ability to mobilise capital.

Medium-voltage mini-grids are expected to be implemented later in the planning horizon due to their larger investment requirements and more complex project development.

Table 18: Connection projections by technology and year

Technology	Electrification Areas	Total Structures	2025	2026	2027	2028	2029	2030
Grid Development	3,439	739,560	14,413	129,130	167,073	146,658	146,263	136,023
MV mini-grids	11	88,679	-	-	-	11,371	-	77,308
LV mini-grids	1421	239,625	10,392	48,368	43,339	55,601	46,385	35,540
Standalone solar	N/A	1,440,007	240,001	240,001	240,001	240,001	240,001	240,002

7.5. Investment Requirements

After evaluating the number of Electrification Areas and the magnitude of their impact on rural communities, the corresponding financing requirements for implementing the REMP can be estimated.

Table 19 presents a year-by-year financing plan for each electrification technology. The financing requirements are derived from the projected implementation schedule presented in Table 17 and the project-level cost analyses generated through the REMP geospatial electrification model.

The investment estimates correspond directly to:

i. The projected number of Electrification Areas to be implemented,
ii. The expected number of beneficiaries to be connected, and
iii. The estimated cost of electrification solutions for each Electrification Area.

Table 19: Investment projections by technology and year.

Technology	Electrification Areas	2025	2026	2027	2028	2029	2030	Total Cost (US$)
Grid Development	3439	12,411,787	61,450,143	114,750,685	125,873,224	146,256,667	161,075,576	621,818,302
MV mini-grids	11	-	-	-	19,059,653	-	143,432,536	162,492,189
LV mini-grids	1421	18,806,379	81,576,089	77,521,152	108,050,604	91,013,542	74,680,753	447,648,519
Standalone Solar	N/A	48,000,200	48,000,200	48,000,200	48,000,200	48,000,200	48,000,400	288,001,400
Total	4871	66,806,579	129,576,289	125,521,352	300,985,709	139,013,742	427,191,295	1,519,960,410

7.6. Financing Strategy and Investment Mobilisation

The implementation of the REMP, with an estimated investment requirement of approximately US$1.52 billion, will be financed through a combination of public and private sector resources, aligned with the financing strategy outlined in Zambia's National Energy Compact.

The National Energy Compact estimates that a total of US$11.9 billion will be required to achieve universal energy access and broader energy sector targets by 2030, of which approximately US$9.5 billion (about 80%) is expected to be mobilised from the private sector. This highlights the critical role of private sector participation in financing Zambia's energy transition, particularly in distributed renewable energy and off-grid solutions.

Within the electrification segment, the Compact indicates that off-grid access investments, including mini-grids and solar home systems, are expected to attract a significant share of private sector financing, supported by enabling policies, RBF, and blended finance mechanisms. In contrast, grid development and last-mile connectivity investments are expected to be largely financed through public sector resources, including Government allocations, the REF, and support from cooperating partners.

In line with this framework, public sector financing will play a central role in supporting grid-based electrification under the REMP, particularly in rural areas where commercial viability is limited. This includes investments in grid development, last-mile connections, and the electrification of public institutions such as schools and health facilities. Public resources will also be utilised to provide viability gap financing to ensure affordability and expand access for underserved communities. Key sources of financing will include Government budgetary allocations through the REF, as well as financial and technical support from cooperating partners.

The private sector is expected to play a key role in financing off-grid electrification solutions, particularly solar mini-grids and standalone solar systems. These technologies are well suited to private sector participation due to their modular nature, relatively shorter implementation timelines, and potential for cost recovery under appropriate business models. Private sector investment will be facilitated through enabling regulatory frameworks, targeted incentives, and RBF mechanisms designed to enhance project viability and attract investment.

Given the scale of investment required and the varying levels of commercial viability across technologies and geographic areas, a blended financing approach will be essential. This will involve the strategic use of public funding to de-risk investments and crowd in private capital, complemented by development partner support in the form of concessional financing, guarantees, and technical assistance. Such an approach will enable the efficient mobilisation of resources while ensuring that electrification efforts remain financially sustainable and socially inclusive.

In addition, the REMP presents significant opportunities to leverage climate finance, given the increasing role of renewable energy technologies in rural electrification. Mini-grids and standalone solar systems contribute to emissions reduction by displacing carbon-intensive energy sources and supporting low-carbon development pathways.

As a result, electrification initiatives under the REMP may be eligible for support from international climate financing mechanisms, including the Green Climate Fund and other climate-related facilities. Access to such financing can help lower the cost of investments, improve project viability, and accelerate the deployment of clean energy solutions in rural areas.

Overall, the financing structure of the REMP provides a realistic and implementable pathway for achieving universal electricity access by 2030, while aligning with national policy objectives and effectively leveraging both public and private sector resources.

CHAPTER 8. ENVIRONMENTAL AND SOCIAL SAFEGUARD REQUIREMENTS

8.1. Policy Framework

Zambia's environmental and social safeguards framework for rural electrification is anchored in national policies that promote sustainable development, environmental stewardship, and inclusive socio-economic growth. The National Policy on Environment (2009) establishes the foundational principle that environmental protection is a shared responsibility among government, private sector, and communities, and emphasizes sustainable natural resource management in all development initiatives.

Complementing this, the National Policy on Climate Change (2016) provides strategic direction for integrating climate resilience and low-carbon development pathways into national planning. It promotes the adoption of climate-smart technologies, enhances adaptive capacity across sectors such as energy and agriculture, and strengthens institutional coordination and stakeholder participation.

Together, these policies provide a strategic framework that ensures rural electrification initiatives not only expand energy access but also contribute to environmental sustainability, climate resilience, and equitable development outcomes, particularly for vulnerable and marginalized populations.

8.2. Legal Framework

The legal foundation for environmental and social management in Zambia is primarily established under the Environmental Management Act No. 12 of 2011 (as amended in 2023). The Act provides a comprehensive framework for environmental protection, pollution control, and sustainable natural resource management, while mandating environmental assessment for all projects with potential environmental or social impacts. It also establishes ZEMA as the regulatory authority responsible for enforcement and compliance oversight.

In addition to the Environmental Management Act, several complementary pieces of legislation provide further safeguards across key thematic areas. These include laws governing land acquisition and tenure, biodiversity conservation, occupational health and safety, public health, labour standards, gender equality, and social protection. Collectively, these legal instruments ensure that electrification projects are implemented in a manner that safeguards ecosystems, protects human health, and upholds the rights and welfare of affected communities.

8.3. Regulations

The operationalization of the Environmental Management Act is achieved through a suite of regulations that define procedures, standards, and compliance requirements for environmental and social management.

The Environmental Impact Assessment Regulations, 2026 (SI No. 3 of 2026) provide a structured process for assessing the environmental and social implications of proposed projects. These regulations require project proponents to undertake Environmental and Social Impact Assessments (ESIAs) and prepare either Environmental and Social Project Briefs (ESPBs) or Environmental and Social Impact Statements (ESIS), depending on the scale and nature of the project.

The Strategic Environmental Assessment Regulations (SI No. 48) extend this requirement to policies, plans, and programmes, ensuring that environmental and social considerations are integrated at a strategic level, including the implementation of the REMP.

Further, the Extended Producer Responsibility Regulations (SI No. 65 of 2018) introduce lifecycle accountability for products, particularly electrical and electronic equipment, requiring producers and suppliers to manage waste responsibly, including through take-back and recycling schemes.

Furthermore, the Environmental Management (Licensing) Regulations (SI No. 112 of 2013) provide for the control and management of activities that may pose risks to the environment and human health. They require project developers to obtain relevant environmental licences for activities such as waste management, air emissions, effluent discharge, and handling of hazardous substances. For rural electrification projects, this is particularly applicable to the management of hazardous materials such as transformer oils, batteries, and other electrical components, as well as the handling, storage, transportation, and disposal of waste, including e-waste. The licensing regime therefore ensures that environmental risks are continuously managed throughout project implementation and operation, beyond the initial approval stage.

Collectively, these regulations ensure that environmental and social risks are systematically identified, assessed, and mitigated prior to and during project implementation, thereby promoting compliance and sustainable outcomes.

8.4. REA Policy and Institutional Framework

REA has established a robust institutional framework to integrate environmental and social safeguards into all its operations. Central to this is the adoption of an Environmental and Social Management System (ESMS), which provides a structured approach for identifying, managing, and monitoring environmental and social risks throughout the project lifecycle.

REA aligns its operations with national legislation as well as international best practices, including the World Bank Environmental and Social Standards (ESS) and the International Finance Corporation (IFC) Performance Standards. This alignment ensures that REA projects meet both domestic regulatory requirements and global standards for sustainability and social responsibility.

The Authority's policy approach emphasizes proactive risk management, gender equality and social inclusion, stakeholder engagement, and transparency. It also ensures that environmental and social considerations are mainstreamed into procurement processes, contractual obligations, and project supervision mechanisms, thereby strengthening accountability and enhancing overall project performance.

8.5. Environmental, Social, Health, Safety, Risk and Impact Management (ESHSRIM) and the Environmental Impact Assessment (EIA) Manuals

REA operationalizes its safeguards framework through key internal guidance documents, notably the Environmental, Social, Health, Safety, Risk and Impact Management (ESHSRIM) and the Environmental Impact Assessment (EIA) Manuals.

These manuals provide detailed procedures and technical guidance for implementing environmental and social safeguards across all project phases. They outline standardized processes for screening, categorization, assessment, and approval of projects, as well as the preparation and implementation of ESMPs.

In addition, the manuals define roles and responsibilities for REA staff, contractors, and supervising engineers, and establish clear requirements for monitoring, reporting, and compliance. They also integrate provisions from the SSF, including requirements related to labour conditions, gender-based violence prevention, stakeholder engagement, and grievance redress mechanisms.

As such, the manuals serve as a critical link between policy and practice, ensuring that safeguards are consistently and effectively applied across all electrification projects.

8.6. Impact on the REMP

The environmental and social safeguards framework plays a central role in shaping the planning and implementation of the REMP. At the strategic level, it requires the undertaking of a Strategic Environmental Assessment (SEA) to evaluate cumulative impacts and inform decision-making at the programme level.

At the project level, the framework mandates site-specific environmental and social assessments to identify potential risks and define appropriate mitigation measures. It also ensures that climate resilience is embedded in infrastructure design, including the adoption of renewable energy technologies and the construction of infrastructure capable of withstanding extreme weather conditions.

Furthermore, the framework promotes inclusive development by ensuring meaningful stakeholder engagement, protection of vulnerable groups, and equitable access to project benefits. It also strengthens compliance with both national legislation and international standards, thereby enhancing the credibility and sustainability of the REMP.

Overall, the safeguards framework ensures that rural electrification is not only technically and economically viable but also environmentally sustainable and socially responsible.

8.7. Project Implementation Process

Environmental and social safeguards are integrated into REA project implementation through a structured and systematic process that spans the entire project lifecycle:

i. Screening

Projects are initially screened to identify potential environmental and social risks and to determine the appropriate level of assessment required (ESPB or ESIS).

ii. Stakeholder Engagement and Consents

Comprehensive consultations are undertaken with affected communities, local authorities, and traditional leaders to ensure inclusivity, transparency, and local ownership. Necessary consents and approvals are obtained.

iii. Impact Assessment

Detailed ESIAs are conducted, and ESMPs are developed to outline mitigation and enhancement measures.

iv. Regulatory Review and Approval

Assessment reports are submitted to ZEMA for review. Upon approval, a Decision Letter is issued, specifying conditions that must be adhered to during project implementation.

v. Procurement and Contracting

Environmental and social requirements are integrated into bidding documents and contracts, including provisions for Codes of Conduct, grievance mechanisms, and compliance monitoring.

vi. Implementation and Compliance

Contractors implement mitigation measures as outlined in the ESMP, while REA and supervising engineers ensure compliance through site supervision and inspections.

vii. Monitoring and Reporting

Continuous monitoring is undertaken to track environmental and social performance and ensure adherence to regulatory and contractual obligations. Findings are documented and reported periodically.

viii. Closure and Evaluation

Post-project evaluations are conducted to assess overall performance, capture lessons learned and inform future project planning and implementation.

CHAPTER 9. ROLE OF GENDER AND SOCIAL INCLUSION IN ELECTRIFICATION PLANNING

9.1. Introduction

The Government has increasingly shown a commitment to gender equality and citizen empowerment, and to mainstreaming gender and social inclusion in its work through various initiatives and legal reforms, including the enactment of the Gender Equity and Equality Act of 2015. This is also echoed in the National Energy Policy of 2019, which highlights the importance of gender mainstreaming in achieving the provision of energy for all.

Key gender issues in the energy sector include a significant gender gap in off-grid access to electricity; low willingness and affordability to pay for energy services between male and female-headed households; a lack of access to clean energy for cooking, disproportionately affecting women; and few women benefitting from employment opportunities and works contracts in energy infrastructure projects. Government is committed to advancing gender equality in the energy sector, as demonstrated through the 2022 GESAP for the energy sector, the Social Safeguards Framework (SSF) and the relaunch of the Zambia Gender and Energy Network.

Further, the Government and its Agencies recognises its responsibility as a public institution to promote gender equality and social inclusion in its operations in accordance with the **Gender Equity and Equality Act No. 22 of 2015**. In 2024, the Authority updated its 2022 Gender policy to a Gender Equality Policy, which promotes the adoption of best practices to affirmation of equal rights for both men and women, including marginalized groups and Persons with Disabilities, to participate in rural electrification initiatives." to participate in REPs.

The policy further establishes zero tolerance for GBV, sexual harassment, discrimination, and other harmful practices, while committing the Authority to promote equal representation and participation of men and women, provide a safe and inclusive working environment, and ensure that both genders benefit equitably from rural electrification initiatives by addressing their specific energy needs. Building on these initiatives, the REMP endeavors to champion gender and social inclusiveness when implementing rural electrification projects.

9.2. Objective

In line with the GESAP and REA's Gender Equality Policy, the REMP aims at enhancing gender equality, social inclusion, and non-discrimination in rural electrification. The specific energy needs and potential barriers of men, women, and vulnerable groups will be considered during project design, ensuring that everyone benefits from the projects, both in terms of access to electricity and employment opportunities during the construction phase.

9.3. Statutory Framework on Gender Equality and Social Inclusion

The key national legislation, policies, strategies, and frameworks governing gender equality and social inclusion are presented below:

9.3.1. Gender Equality Strategy and Action Plan

Gender and Social inclusion in energy projects are mainly guided by the GESAP for the energy sector. The GESAP is underpinned by five strategic objectives, namely:

i. To increase access and use of clean energy for domestic and productive purposes.
ii. To increase social and gender integration in energy infrastructure projects,
iii. To promote equal representation and participation of women as decision-makers, employees, and entrepreneurs in the energy sector,
iv. To strengthen institutional capacity to mainstream gender in energy policies, energy programmes, and within organisations; and,
v. To increase coordination, collaboration, and financing gender equality in the energy sector.

9.3.2. Social Safeguard Framework

MoE's SSF, developed as part of the IRP, contributes to the second objective of the GESAP (To increase social and gender integration in energy infrastructure projects). The SSF targets developers and contractors and aims to prevent or mitigate social risks and the negative impact of energy projects, while promoting opportunities and positive impacts.

9.3.3. Other Legislation and National Commitments to Gender and Social Inclusion

The activities and requirements in the GESAP and the SSF are informed by various pieces of legislation, as outlined below:

i. **The Employment Code Act No. 3 of 2019**: provides comprehensive protection against discrimination and promotes equal rights for all individuals in the workplace. It promotes affirmative action in employment, ensures equal pay, and parental leave entitlement.
ii. **The Gender Equity and Equality Act No. 22 of 2015**: Promotes gender equality, prohibits gender-based discrimination, and ensures equal opportunities for all individuals regardless of their gender. It obliges public and private bodies to develop gender action plans and put measures in place to achieve 50% representation of women.
iii. **The Citizen Economic Empowerment Act No. 3 of 2006**: Establishes the Citizens Economic Empowerment Commission and aims to promote economic empowerment of citizens. It obliges state institutions and companies to prepare and implement an employment equity plan, which shall include numerical goals to achieve the equitable representation of suitably qualified targeted citizens within each occupational category and level in the workforce, as well as the strategies intended to achieve those goals.
iv. **The Persons with Disabilities Act No. 6 of 2012**: Protects the rights of persons with disabilities and promotes their inclusion in society.
v. **The National Youth Development Council Act**: Establishes the National Youth Development Council and aims to empower and promote the well-being of the youth.

9.4. Gender Equality and Social Inclusion Constraints

Large gender inequalities exist at decision making, the consumer level and across the energy value chain. While the connection rate to the national grid is almost equal for male and female-headed households in urban area, there is a significant gender gap in off-grid electricity access. In rural areas, male-headed households are almost five times as likely to use off-grid solutions as female-headed households, likely due to differences in affordability and willingness to pay.

A lack of strategy towards clean cooking has a disproportionate impact on girls and women due to the roles traditionally assigned to them. Constraints on gender equality and social inclusion exist equally in the generation, transmission, and distribution of energy. Although women's employment in the sector has increased, a large gender gap persists in technical and management positions. This is partly a reflection of the available pool of candidates, but is also a result of gender bias and the absence of deliberate policies and measures among energy institutions to recruit and retain women.

Other groups that are often excluded are youths and Persons with Disabilities (PWD). Youths account for over 75% of the unemployed in Zambia, with implications for innovation and economic sustainability. Unemployment rates are high among PWD, especially men, who face discrimination and accessibility challenges.

9.5. Key GESI Priority Areas for the REMP Investment Plan

To address the constraints above, the following interventions will be implemented;

9.5.1. Promote Community Participation and Adopt Employment Quotas for Targeted Citizens

The legal and policy framework on gender equality and social inclusion in Zambia obliges public and private bodies to adopt numerical goals and affirmative action measures to increase the representation of women and other targeted citizens. In the implementation of the REMP projects, REA will adopt the recommended employment quotas provided in MoE's SSF (Social Standards 3 on Non-discrimination and Equal Opportunities) as outlined below:

i. At least 80% of the total workforce will be Zambian nationals. Out of this number, at least 70% will be community members from the project area (communities within a 10 km radius of the project site);
ii. At least 30% of the total workforce will be women;
iii. At least 30% of the total workforce will be youth (persons aged 19 to 35 years); and
iv. At least 5% of the total workforce will be PWD.

9.5.2. Incorporating Clean Cooking in Electrification Projects

Clean energy for cooking is a critical need for rural women and girls, who, due to their traditional roles, spend many hours collecting firewood and are exposed to smoke, leading to respiratory diseases and eye problems. The need for clean energy for cooking is emphasised in GESAP, which advocates for the implementation of a nationwide clean cooking programme. Although REA's mandate primarily focuses on productive use of energy, section 4 (j) of the Rural Electrification Act states that REA shall "undertake such other activities as are conducive or incidental to the performance of its functions under the Act". Therefore, REA has a strong business case for including access to clean cooking technologies, given the associated environmental and socio-economic benefits. Switching to clean cooking can deliver 'triple wins': 1) reduced deforestation and climate change emissions, 2) improved health and wellbeing, and 3) increased employment and income generation among women and other vulnerable groups, as electricity can free up time traditionally spent on domestic chores, particularly cooking. Furthermore, clean cooking will be integrated in REA's community engagement strategy.

9.5.3. Integrating "Complementary Services" to Support Initial Connection Charges and Amplify the Positive Impact of Electrification

Electrification projects under REMP will be accompanied by complementary services such as credit facilities, entrepreneurship training, the creation of savings groups, social marketing of electric appliances, and other initiatives. This will support initial connection charges that may be unaffordable for poorer households, as well as increasing the uptake of energy services for productive and domestic use, leading to improved livelihoods.

9.5.4. Affordability and Willingness to Pay for Different Groups

Areas with Female-headed households are significantly less willing to pay for an electricity connection and a SHS in comparison to male-headed households. This has translated into a significant gender gap in electricity access in off-grid areas (see GESAP for more information). In on-grid areas, although the gender gap in electricity access has been closed by deliberately targeting female-headed households, low willingness to pay for a connection will affect grid densification.

To increase grid densification and off-grid electricity access, REA will conduct a study on affordability and willingness to pay, focusing on understanding the reasons for lower willingness to pay in female-headed households, such as differences in affordability and access to information. Other factors, such as age, civil status, disability, and educational level, that may affect affordability and willingness to pay must also be investigated.

It is paramount that this study is conducted in a way that allows for comparison across different groups to identify vulnerable segments of the population in need of subsidies or other interventions to increase electricity access.

9.5.5. Adoption of Gender-Responsive Procurement

REA will adopt gender responsive procurement, as highlighted in the GESAP, through three main approaches:

i. Contractual obligations: Incorporation of social and gender requirements in tender documents, including Terms of Reference, Technical Specification, Bill of Quantity and Project Contracts. E.g., employment quotas for women, awareness on HIV and GBV among workers and communities, distribution of comments etc.
ii. Evaluation and Qualification Criteria: Include criteria on gender equality/social safeguards performance in the evaluation of bids, such as the number of accidents and the number of women employed.
iii. Adoption of preference or reservation schemes in the procurement process in accordance with the Public Procurement Act and regulations. These schemes could target companies owned/led by targeted citizens (women, youth, PWD) or companies that promote gender equality and social inclusion internally.

9.5.6. Support Businesses Owned or Led by Women, Youth or Persons with Disabilities

REA will map the key areas along the REMP value chain where contractors, suppliers, and service providers will be needed, and identify businesses owned or led by women, youth, or persons with disabilities within these areas. These companies will benefit from capacity-building initiatives and preferential access to financing and subsidies. The capacity-building support may encompass technical skills development and bid-preparation training to enhance their competitiveness in procurement processes.

9.5.7. Integrate Social and Gender Considerations in the Environmental Social and Impact Assessment of Projects

The implementation of the REMP will ensure Environmental and Social Impact Assessment includes a social and gender analysis, and specific measures on social and gender impacts are included in the ESMP. When an EIA is conducted by an external firm, these requirements will be reflected in the Terms of Reference, including the required Personnel which must include a Gender Expert of Sociologist with gender expertise.

CHAPTER 10. MONITORING AND EVALUATION OF ELECTRIFICATION PROGRESS

10.1. Introduction

Monitoring and Evaluation (M&E) are essential components of the REMP implementation framework. These activities provide a systematic mechanism for tracking the progress of electrification initiatives, assessing the effectiveness of implemented interventions, and generating evidence to support informed decision-making in the rural electrification sector.

Through monitoring and evaluation, GRZ and other stakeholders will be able to determine whether electrification projects are being implemented according to plan, identify challenges affecting project delivery, and assess the socio-economic impacts of electricity access in rural communities. The results of M&E activities will also provide important inputs to improve project implementation and guide the periodic review and updating of the REMP.

10.2. Objectives of Monitoring and Evaluation

The M&E framework under the REMP aims to achieve the following objectives:

i. Track the implementation progress of rural electrification projects across the country;
ii. Assess whether electrification projects are being implemented in accordance with planned timelines, budgets, and technical standards;
iii. Measure the outcomes and socio-economic impacts of electrification interventions in rural communities;
iv. Identify implementation challenges and provide evidence to support corrective actions and improvements in project delivery; and
v. Generate lessons learned to inform future electrification initiatives and periodic updates of the REMP.

10.3. Key Indicators for Monitoring Electrification Progress

Monitoring the implementation of the REMP will involve tracking key performance indicators that reflect progress in expanding electricity access in rural areas. These indicators will provide measurable evidence of the outputs and outcomes achieved through electrification initiatives.

Key indicators to be monitored include:

i. Number of households connected to electricity;
ii. Number of public institutions electrified, including schools and health facilities;
iii. Number of mini-grids developed and operational;
iv. Number of solar home systems deployed;
v. Number of clean cooking solutions distributed;
vi. Rural electrification access rate;
vii. Number of productive-use applications supported in electrified communities;
viii. Percentage of households actively using electricity services;
ix. Percentage of households using modern clean cooking solutions;
x. Reduction in the use of traditional biomass fuels for cooking;
xi. Improvements in service delivery in electrified public institutions;
xii. Changes in household income levels in electrified areas;
xiii. Improvements in health outcomes associated with reduced indoor air pollution;
xiv. Changes in household expenditure on energy; and
xv. Investment levels in rural electrification infrastructure.

Tracking these indicators will enable stakeholders to measure progress toward achieving the national target of universal electricity access by 2030.

10.4. Institutional Responsibilities

The M&E of rural electrification initiatives will involve several institutions responsible for policy oversight, project implementation, and sector regulation. The MoE will provide overall policy guidance and oversight for monitoring progress in the rural electrification sector.

REA will play the central role in monitoring the implementation of rural electrification projects. REA will undertake monitoring activities through project reporting systems, desk reviews, and field visits to project sites.

Other institutions, such as the ERB, local authorities, project developers, and cooperating partners, will also contribute to the monitoring process by providing relevant data and progress reports related to project implementation.

10.5 Digital Monitoring, Reporting and Verification (d-MRV) Platform

To strengthen monitoring and reporting of electrification initiatives, REA will develop a national d-MRV platform to support the collection, management, and analysis of electrification data across the REP.

The d-MRV platform will serve as a central digital system for tracking the implementation and results of electrification projects across the country. The system will enable the capture and verification of key information, including the number of electricity connections achieved, electrification technologies deployed, project locations, and other relevant performance indicators.

The platform will also enable the integration of data from multiple stakeholders, including utilities, private developers, and implementing agencies. Through dashboards, reports, and spatial visualisations, the system will support real-time monitoring of electrification progress and improve transparency in the implementation of rural electrification initiatives.

The d-MRV platform will further support results-based monitoring and verification of electrification outcomes, particularly under programmes supported by cooperating partners. Information generated through monitoring activities, baseline surveys, end-of-project evaluations, and ex-post evaluations will feed into the platform, enabling systematic tracking of electrification progress and supporting evidence-based decision-making in the sector.

10.6. Data Collection and Evaluation Processes

The M&E activities will involve a combination of continuous monitoring and periodic evaluation processes designed to assess both project implementation progress and long-term development impacts.

10.6.1. Monitoring

Monitoring will cover both the implementation of individual project activities under the REMP and the overall performance of the Plan as a strategic framework, ensuring that short-term outputs and long-term outcomes are consistently aligned.

10.6.1.1 Monitoring of project development in the REMP

Monitoring of project development will be conducted periodically and will involve a continuous assessment of the progress of project activities and outputs to ensure that they remain on track. It will focus on activities being executed, the parties involved, and the tracking of indicators such as timelines, budgets, and deliverables.

The results of the monitoring activities will inform whether the project is progressing as envisaged in the project plan. Throughout project execution, REA will conduct monitoring activities through monthly desk reviews and field visits.

10.6.1.2 Monitoring of the REMP

The monitoring of the REMP will be undertaken as a structured process to assess the performance and relevance of proposed electrification strategies. The framework will track the implementation of key components, including technology deployment (grid development, mini-grids, and standalone solar solutions), demographic changes, demand growth, infrastructure expansion, and investment flows, ensuring alignment with least-cost electrification pathways.

The process will monitor changes in population distribution, urbanisation trends, and the growth of Electrification Areas, alongside evolving energy demand from households, social infrastructure, and productive uses. It will also assess technology performance and costs, including capital, O&M, and replacement costs, to ensure continued cost-effectiveness and adaptability to market and technological developments.

Additionally, the framework will evaluate policy alignment, institutional coordination, and private sector participation, as well as environmental and social compliance, including lifecycle sustainability of deployed systems.

A mid-term review will be conducted within the Plan period (2025–2030) to assess progress, validate assumptions, and adjust strategies where necessary. A terminal evaluation in 2030 will assess overall impact, including access, service reliability, and cost-effectiveness of investments. The process will be supported by geospatial data systems and national surveys to ensure evidence-based decision-making and continuous improvement of the Plan

10.6.2. Evaluations

The project evaluation process will be a systematic assessment of project outcomes, impacts, and effectiveness. It will measure whether the project meets its objectives and will assess the long-term effects of the interventions. The process will also involve data analysis to understand successes, challenges, and areas requiring improvement. Evaluations will be conducted before the commencement of project implementation, midway through the project life cycle, and after project completion.

The evaluation process will include baseline (ex-ante), end-of-project, and ex-post evaluations to assess the projects' impact on rural communities. These evaluations will also identify lessons learned and highlight areas for improvement to inform future projects. The following evaluation activities will be undertaken through desk reviews and field visits.

10.6.2.1 Baseline surveys

Baseline surveys will be conducted prior to the commencement of implementation of each project. The surveys will be conducted to establish the current socio-economic and demographic profile of the targeted beneficiary communities/population. The information will be used to identify trends and establish a baseline against which project success will be measured. The results will be project-specific, highlighting unique characteristics of the environment where the project is to be implemented.

10.6.2.2. End of project evaluations

End-of-project evaluations will be undertaken on newly completed projects to measure intermediate outcomes. This will be done to assess the effectiveness and relevance of the process used to implement the projects. The exercise may be conducted more than once to track expected outputs and immediate outcomes. The findings from these evaluations will feed into the Ex-Post Evaluation and the D-MRV platform and inform the periodic updating of the REMP.

10.6.2.3. Ex-Post Evaluation

The Ex-post evaluation will be undertaken 3 to 5 years after project implementation to determine the long-term socio-economic benefits of electrification in rural communities. The evaluation will be conducted with the support of independent consultants and will have a countrywide focus.

The evaluation will review the number of actual electricity connections achieved and assess how access to electricity has influenced the livelihoods and well-being of beneficiary communities. In addition, the evaluation will examine the appropriateness and performance of the electrification technologies deployed under the projects.

The ex-post evaluation will also provide an opportunity to identify additional potential areas for electrification and to generate lessons learned that can inform future electrification initiatives. The results of the ex-post evaluations will feed into the d-MRV platform and inform the periodic updating of the REMP.

10.6.2.4 National Energy Access Survey (NEAS)

The NEAS will be conducted every 2 to 4 years as a systematic exercise to assess the status of energy access in Zambia. The survey provides a comprehensive evaluation of access, reliability, usage, and sustainability of energy services, and serves as a key instrument for informing policy formulation, sector planning, and investment decision-making. The survey will be undertaken by REA, MoE and ZamStats.

The survey process will involve the collection and analysis of data to evaluate the level of access national wide and its ability to meet the needs of households, businesses, and public institutions. The survey also evaluates transitions within the energy sector, including the shift from fossil fuels to renewable energy, adoption of improved cooking technologies, and the contribution of biofuels in the national energy mix.

The results of the survey will be published in the NEAS report and inform the periodic updating of the REMP.

10.7 Adaptive Management and Continuous Improvement

The findings from M&E activities will be used to support adaptive management of rural electrification initiatives. Lessons learned from project implementation will inform improvements in planning approaches, project design, and technology deployment.

Monitoring results and evaluation findings will also provide key inputs into the periodic review and updating of the REMP, ensuring that the plan remains responsive to changes in demand, technology developments, and emerging opportunities within the rural electrification sector.

Through this approach, the REMP will serve as a dynamic planning framework that evolves continuously based on implementation experience and evidence from M&E activities.

CHAPTER 11. CONCLUSION AND RECOMMENDATIONS

11.1. Conclusion

The REMP 2025–2030 provides a comprehensive and strategic framework to accelerate electricity access across rural Zambia and support the Government's commitment to achieving universal access to electricity by 2030. The update responds to significant demographic, geographic, and socio-economic changes since the development of the 2008 REMP and aligns Zambia's electrification agenda with national development frameworks, including Vision 2030, the National Energy Policy, and the Sustainable Development Goals, particularly SDG 7 on universal energy access.

The REMP introduces a transformative planning approach by shifting from the RGC concept to the Electrification Area framework, which focuses on electrifying all rural communities rather than selected service centres. Using the LCGEP methodology, the plan identifies the most appropriate and cost-effective electrification technologies for different rural areas, including grid extension, solar mini-grids, and standalone solar systems. This multi-technology approach ensures that electrification solutions are tailored to the demographic, geographic, and economic characteristics of each Electrification Area.

The analysis undertaken in the REMP demonstrates that significant progress has been made in expanding electricity access, with the rural electrification rate increasing to 34% according to the 2023 NEAS. However, a substantial gap remains in achieving universal access by 2030, requiring accelerated investment and coordinated implementation efforts across the sector.

Achieving universal access between 2025 and 2030 will require approximately 2.5 million new connections at an estimated cost of US$1.52 billion through grid development, mini-grids, and standalone solar systems. This will require strong collaboration among GRZ institutions, development partners, the private sector, and local communities. Innovative business models, effective coordination mechanisms, and improved financing arrangements will be essential to mobilise the required resources and ensure sustainable implementation.

The REMP also recognises the importance of integrating gender equality and social inclusion, environmental and social safeguards, and the productive use of electricity in rural electrification initiatives. These considerations are essential to maximise the socio-economic benefits of electrification and ensure that electricity access contributes meaningfully to rural development, poverty reduction, and improved service delivery in sectors such as agriculture, education, health, and small enterprise development.

Furthermore, the establishment of the Visualisation Platform provides a modern digital tool to support planning, monitoring, and coordination of electrification initiatives. The platform will enable stakeholders to access key data on Electrification Areas, proposed electrification technologies, and investment opportunities, thereby enhancing transparency, facilitating private sector participation, and improving evidence-based decision-making in the rural electrification space.

Overall, the REMP represents a critical milestone in Zambia's energy sector development and provides a clear roadmap for accelerating electricity access in rural areas. Its successful implementation will contribute significantly to improved livelihoods, increased economic opportunities, and sustainable rural transformation.

11.2 Recommendations

To support the effective implementation of the REMP, the following recommendations are proposed:

i. Strengthen Institutional Coordination

The MoE, in collaboration with REA, should continue to strengthen coordination mechanisms among institutions involved in rural electrification, including government agencies, development partners, local authorities, and private sector actors. Improved coordination will enhance alignment of electrification initiatives, reduce duplication of efforts, and promote efficient implementation of projects across the country

ii. Mobilise Sustainable Financing for Rural Electrification

GRZ should continue to mobilise adequate and sustainable financing to support the implementation of the REMP. This includes leveraging public resources, development partner support, RBF mechanisms, carbon finance and private-sector investment to meet the significant capital requirements to achieve universal electricity access by 2030.

iii. Promote Private Sector Participation

GRZ should continue to create an enabling environment that encourages private-sector participation in rural electrification, particularly in the development of mini-grids and the deployment of solar home systems in areas where grid extension may not be economically viable. Clear regulatory frameworks, investment incentives, and transparent project identification processes will be essential to attract private-sector investment.

iv. Enhance Monitoring and Evaluation Systems

REA, in collaboration with relevant stakeholders, should maintain a robust M&E framework to track the implementation of electrification projects and assess their outcomes and impacts. Regular monitoring of electrification indicators and periodic evaluation of project performance will help identify implementation challenges and inform improvements in project design and delivery.

v. Periodically Update the REMP

REA should maintain and continuously update the REMP geospatial database to ensure that the plan remains current and responsive to developments in the rural electrification sector. The REMP has been designed as a living planning framework, supported by a geospatial database that enables efficient incorporation of new information as it becomes available.

This approach will enable updated datasets, such as new electrification projects, infrastructure developments, demographic changes, and survey results, to be integrated into the planning framework without requiring a full revision of the entire master plan. Maintaining an up-to-date geospatial database will therefore support more effective planning, coordination, and investment decision-making in the rural electrification sector.

ANNEXES

ANNEX I: GRID EXPANSION ELECTRIFICATION AREAS

No	Electrification Area	Province	District	Voltage (kV)	Connections	Total Cost (US$)	Cost per Connection (US$)	Implementation Year
1	Chikobo Rural Health Centre	Central	Chibombo	11	54	37,870	701	2025
2	Shimukuni Primary	Central	Chibombo	11	62	49,703	802	2025
3	Shiyala Primary School	Central	Chibombo	11	77	65,592	852	2025
4	Kakunka Primary	Central	Chibombo	33	54	54,518	1,010	2025
5	Chombela Day Secondary	Central	Chibombo	11	931	1,033,513	1,110	2025
6	Chipako Primary	Central	Chibombo	33	52	62,030	1,193	2025
7	Chipako Primary	Central	Chibombo	33	59	70,231	1,190	2025
8	Chikobo Rural Health Centre	Central	Chibombo	11	83	102,575	1,236	2025
9	Kafululu Primary	Central	Chibombo	11	83	103,330	1,245	2025
10	Mulonga	Central	Kapiri Mposhi	33	58	61,519	1,061	2025
11	Mibanga	Central	Kapiri Mposhi	33	61	64,059	1,050	2025
12	Mikunku Primary School	Central	Kapiri Mposhi	33	216	212,830	985	2025
13	Kasonka	Central	Luano	33	47	36,204	770	2025
